 experiments in which he had distilled gas iman enal. It wis mot. howere till 17 the that the manhity of applyius was di-tilled from coal, to the pmon tion if artition lime was Almonstrated. In that sear, Ar Willian Momone construeton alparathis by
 in Cornwall. !at lic, he lightul pat of the mams-

 lan th lisht a purtion of faris with gis in land 10 the suecomture arar, Mr Winsun commenced

of a sauquine and anthasiastic temper, his strour statements fubably tomed to retaral rather than al wance the new art. He pomised to every depositor of $x \cdot 5$ an income exceding hoth premam, and he wred the qovernment to take the matter into their own hames, as a certain means mot only of clearing wh the national delet, but of securiug a permanent and large revenue to the comaty. The chartered (ias Company of Lombon. whinh was the first compasy incorporated, obtaned their act of parliament in 1blo. At that time, Mr Winsur, whe had been instrumental in establishines the company, was employed hy them, hut in 1513 they fonud it neessary to entuge the late Dle samal clese whe, from the year 1805 , hat been engaged in promoting the use of gas, and to whose ingenuity awh seientifie skill the chartered company, as well ats the commanity, were graty imbelited. Mr Cleseg was the insentor of the hyilrandie man, of the wet-lime purifier, and of the wet gasmetor, all which were essential to the snceess of gith lichting.

As the first gas applied to artiticial lighting was olitained from cual, so, owing to the economy atteuding its mannacture, the use of any other materiat only oceurs when coal cannt be obtaned except at an exombitant price, and where other gasyiekling materials are masually cheap. hesin aud oils are the best sulntitutes for coal.

Destrutive distillation hy the action of heat is in all rases the moans empluyed to disengage the gas from the raw material, the apmatus and procosas being modified to suit the baterial operated upon. As the mamfacture of com-gas is not only the most gencral, hat alsin the most interesting of these processes, and as the monde of storing, distrilouting, and using the gat is the same in all. the mamufacture of cual-gas only will he hare deserbled.

As a manch of manfacturing industre, cont-gas. works vechly in impurtant prition, not only from the immense eapital permanently cmbarked, and the seat number of lemis emphered in them. hat also from the demand reated lis them for coal. lime, \&c., and for imworl, haswork, and gasmeters. In Emmbon alone the agregate shate capital of 17
 of large sums of herrowed rapital. In Eughad, there are above 400 gas companies: in Scotland, above 150; in lrolath above 60; and there are in the three kinghms alnut 130 son-works, the property of individuals or of corperations. The coals best adapod for the manfacture of gas, are those known in England by the name of cannel, and in Scotland by the name of parrit coals. The English cilking coals, of which a sheat mart are obtained in the ncishbouhmel of Neweastle-nn-Tyne, are, however, from the fir cheapuess and the superior quatity of the coke which remains after distillation, more extensively used than any ather. In Scotlanl, parrot coals are used ahmest exchsively. C'annel is used exclusively in Liverpmol. Manchester, and some other towns: a proportion of eanald or of Seotel parrot is used with caking mod in Lomon and other phaces to improve the of andy of the gas, lant in Englam generally the ers is made from eaking eoral. The coke of the Enylish eamel coals 18 of fair "flality; thand inferion to that of the eaking enals. The coke of the Seoteh parrot conls is very inferior, that of same bemin altogether worthless.

The Furlinh caking coals yich from soon to 10.016 cultie feet of gas per tom, of illminating pher varying from 10 to 12 sperm candles to a lamer consming the feet por linur. The English camel eonats yielit atomat 10.000 culve feet per ton, of illmmatin, power varying from 20 to 24 sperm candles, The sentch parot eoals are very vanons

The dry wismeter possesses some aivantages,

Iry Meter-front wiew upen.
Whinh, were it in other respets equally estemal with the wet mator, would wase it the preferace. Ouce aljustel, it gives mo further tromble; it is mot liable to derancment in frosty weather; and, in bassing through it, the eas takes mp an adlitimal masture to increase the disk of ammance from clepusit of water in the pipes. Put dmelota are entertaned be many of the lumability of the machine as an ethient and correct mensure The meter is made in various forms, and consists of chambers separated from each otherby partitious: gencrally there are two, hont some makers we there rhambers. Each chamlow is divided into two parts ly a flexible pretition which moves lackwatis and forwards, its motion being raylaterl ly valves beautifully
 matrival for the pmo !nsis. The meter thears Ibry Meter-sile wiow open. :nn resemblance to a Whuld or triphe steam-empine. Following ont this mamhlane, Ahe 'roll thus tescribes his meter: - It comsists of a cylinder divided by a plate in
the centre, into two separate cylindrical compart. ments, which are closed at the opposite ends by metal dises; these metal dises serve the purpose of pistons, and they are kept in their phaces by a kind of universal-joint adated to each; the space throunh which the dises move, amb, ennsequently, the means of measurement, is povernet ty metal arms and rols, which space, when ance aljusted, camot vary. To avoil the friction attendines a piston workine in a cylinder, a band of leather is attached, which acts as a hines, and fold, with the mation of the dise; this band is unt instrmmental in the measuring, so that if it were to contract or pepand, the registering of the meter woul not low affected, inasmuch as it woud only decrease or increase the capacity of the hinge, the dise still leing at liberty to move throngh the required space; the leather is also distributed in such a manner, being curvol, and bending only in one direction, that it prevents any wrinkles or creases forming, and renters it therefore much more durable. The arrangenent of the valves and arms are somewhat different to that of a steme cngine, althongh similar in primeipe?

Consumers of gas should bear in mind, that the purpuse of the moter is to inform thom bow much gas they are expenting; and that whale the sellor of gas camot visit it but at long intrrals, the purchaser may from day to day, if he pleaser, ascretain the quantity which has passed through the metw, and so detect irresularity or waste, which, if alluwed to go on, would ind denibt be put down to error on the part of the sedler of gas.
Ges-burners-The hurner made on the areand principle is still the best when carefully used, but it is expensive, somewhat tronblesome to keep chan, and involves outlyy for chases from time to time Jets and batwings have, consequently, almust supphanted it. These burners are now matle hy machincry at very low prices, so that to chance them when out of order costs little, and is easily done. They are also sery casily clemed. Jets are of two kinis-cockspurs and mion-jets. The cockspurs are gierced with ouc or more straight hales; the nime jets are piorced with tro heles at an angle to cach other, so that the streams of gas issuing from then impinge on each other, ant produce of hat thane. Batwings are mate with a clean slit across the had of the burner. lias containing a great quantity of carbon requires lurners with smaller aportures than gas contaming hitle carbon, bectuse when cmitted too frecly, the carbon does not come into contact with a sufficient gantity of oxyen, aml the thame smokes: again, when the was is emitter in ton small a quatity, the flame becomes hute, and its ilhminating jower is diminished, hecause the earbon
comes too rapidly into contact with oxygen. The light is emitted by the carlou when suspended for an instant in the flame in an incondespent stat", and the thane which is enpable of suspemding the largest propertion of carlun in a state of incandescence, ultimately consmours the whale of it, will give the mont panerful lient from the mand pataraty of ga*, Aceorlingh, anmaque yellowish llann, which is just at the smoking puint, is more econmaneal than a hoish-white llanme for lightine purpers.

There ate many entrivanow for impone harners and ingroved mokes of using ens. Of these it is anough to mention the sur lighte iutronlumen by Mr Kinge f liveruool. These comsist of a rine of union. jets, placel horizontally and set ond the lase of a cone which is pased thanth the railing and convogs away the products of combustion through a Hhw, thus serving looth for lighting and ventiating the aprartments in whish they are need.
hivententars.- She ohject of these instruments is to restrint the supply of was when sunalmulant, and it shand be anticed that the supply rempires to be sulderere any alvantage can result irm the use of them. I ronionl valve, oquatiny by the pussure of the gis in a manner smilar to the somerner at the gas-woms, is in gemeral the acting gart of the jparatus.
The impurities which stamh twe remen in the manufacture of coalyas are sulphomethl hydrumen, : phometed hydrogen is detected ly alhwing is strem of the gas to phay an apur wetted with a smbtion of ace tate of leal, the test-paper is backener it the draterimes ans he present. Ammonia is aleteremd ly allowing the gas to flay on 1 "un : tiamen yoblow with tarmeric. Ammonia changes the ollaw to hown. The presence of carmmie actit can be ascertained ha cansing the ens to labla throu-h limewater. If carlmic acid le present, it cembines with the lime, and the water beomes milliy:

The value of yas for lighting deperds on its illuminating power, which asain manly inpents on the propartion of weliant gas and heary hymbealans contained in the misture. The shecitic graver of the gas whalle a complete: test of the manimating joser, were it first accertained that no bleterions gases were contaned in the mixtur:. The chborine and homine tosts, which are aphind by bringing the gas into contact with either iof than shlistances in a mathated tulne, also require that the absence of dheterins gises twe asecrament. Thlorine and
 carbmes, and the jrumortion of them present is ascertanel by the prourtion of the gas which is condensed.

The most practicat mode of determining the illuminating power is ly the nse of the Bunsen fhotometer, introntuced into this country by Ir I.yon I'layfair, and atayted by Mr King of Liver-
pool. At one end of a straight lar of wood, a gasfurner is monntin; an the uther emil. a emullestick. These are su phacet, that when lighted, there are exactly 100 inches hetwow the eentres of the lights

-The 1 rocess of diffusion,' says Profussor Miller. is one which is continually periorming an important part in the atmosphere arombl us. Accmanlations of gases wheh are untit for the support of animal ami rometable life are by its means salently amb spedily dipersed, and this pruess therehy dontriiutes largely to maintain that mifurmity in the compusition if the ational ocean which is so esecntial to the comfort and health of the animal ereation. Respiration itself, lut fur the process of diffusion. would fail of its apmonted ent, 10 rapilly renwim? to the lumes a fresh supply of air, in phace of that which has been renilertil unfit for the sulport uf life by the chemical changes which it has undersone.'

A reference to the last two columns of the ahove talle shews that, within the limits of expermontal -rrors, the rate of effusion of cach gas coinciles with its rate uf mitfusion.

Cralam's experiments shew that the velocity of tranapiration (the term: which that chemist applied to the passage of gas throngh lone capillary tubes) is entirely independent of the rate of difusion, or of any other known property. It varies with the chemical nature of the gas, and is most protinhly "the resultant of a kind of elasticity dependine upen the abselute quantity of heat, liftut as well as sensible, which different yases contain under the same rohme; and therefore will be foumd to lo ernnectel more immeliately with the speefic leat than with any other property of gases.' Oxygen is frime to have the lowest rate of transpiation. Taking its transpiration velocity at 1 , that of arr is $1 \cdot 1 / \overline{-4}$; of nitronen, $1 \cdot 141$; of earbonic acid, 612

1:69: of sulpharetted lydroren. 1 61 ; of ammonia,

In the passare of gases thromb thaphaums, the law of the dithinim of gases is more or less nisturbed or monlitien accorling to the force of athesinn in the material of which the diapharem is compens : the disturbance beine greatest in the ease of soluble gases and a muist thin diaphragm, such as a lobalier on a mabit's stomath. Fur letails on this suloject we must, howewer, refer to the article Osmust.

All gases are more or less soluhle in water and other lipuils. sume gases, as, for example, hydrochlonic achin and amomia, are alsorbed by water bery rapidly, and to a great extent, the hquit taking up for in buo times its bulk of the gas: in other eases, as carbmic acid, water takes up its own volume of the gas ; whilst in the case of nitrogen, oxyen, and hydrogen, it does not take up more than irom $\frac{1}{2}$ to $\frac{1}{60}$ of its loulk. 'As the clasticity of the gas,' says lrofessur Miller, 'is the power which is here oprosed to allhesion, and which at length limits the quantity dissolved, it is found that the solubility if each gas is greater, the lower the temperature, and the greater the pressure excrted non the surface of the liquil. Dr Henry found that at any given temperature the rolume of any gas which wat ahsorted was uniform, whatever might be the pressure : consequently, that the weight of any given gas absorbed by a given volume of any liguid at a fixed tourerature, increased directly with the pressure. If the pressure be miform, the quantity of auy given gas absorbed by a given liquid is also nuiform for each temperature; and the numerical

## GASES

expression of the solubility of each gas in such loubles. small as is the quantity of oxycen thus
liquits, is termed its corficiont of absorption or of solubilily, at the partienar temperature and pressure. the colume of the gas alosorind beine in all eases
 inches of mercury. Thus, 1 shmme of water at $3^{2}$, and under a pressure of 29.9 inches of the baronetor. dissolves 0.01114 of its volume of oxyem ; and this fraction represents the coctlicient of ahsortion of exygen at that tomperature anl pressura. Simi. larly, the condicient of absurption of common air is 002til. In censerquence of this solubility of the air, all water contains a cortain small propirtion of it in solution: and if phacel in a ressel whar the air-pump, so as to rentwe the athospherie pressame from its surface, the disshlvel gases rise in minato
takn up ly water from the atmosphere, it is tho mesns of maintamine the lifi of all antutic animals. If the air tox explled from water by boiling and it le emmeral with a layer if oil, to prevent it from ayain alosorling air, tish or any aquatic animals phacel in suth water ruickly perish. Even the life of the knprow animals is inpmedent upon the soluhality ut asyen in the than which moistans the ar-tuhe of the hangs, in consergmence of which this tas is absorthel into the mass of the hoorl, anol cirmlat"s thrman the pmanomary vessels.

The fullowing talde, trawu up frome the researches of Bunsen and C'arius, shews the sulublitity of som, of the munt impurtant grece, buth in water and almbol:

All these gases, with the exception of hyalrochloric ach, may be expelled from the water by lungcontimed boiling.
Gases are not absorbed by all liquids in the same order: for example, naphtha alsorbs most olefiant gas, oil of lavemer most protoxile of nitrogen, olive oil most carbonic acil, and solution of chluride of putassium most earlonie oxide.

If a mixture of two or more gases lie agitated with water, "r probally any other lignish, a 1 nertion of ench gas will he ahsurnerl, athe the anmant of eath so alsubed or dissobed will be fropertional to the relative volume of "mh gas multiphich with its coedficient of soluhility at the observel temper ature and pressurio is all ordinary liquils exint a Erater ur less sulvent action on srises, a was that we wisl to exmine quantitatively should be collected over mereury.
'Ihe aulhesion of gases to solids next rexpuires notice. Hastrations of this phenomenn perpetually occur. Thas, wool and other solid substances immersed in water or other lipuils appear eovered with air-bulhbles. It is this athesion of air to the surface of ghass tulues which canses the clithenlty of obtaining harometers and thermometers connuletely free from air. It is in consequence of the athesion of air to their surfaces that many small iusects are enabled to skim lightly ower the surface of water which does not wet them. A simple method of illustrating this phenomenon is by gently dusting iron tilings over the surface of a vessal! w water, if we pruced carefully, a considerable mass of the iron may accumulate upon the surface; till, at last, it falls in large thakes, carrying down with it numerous bubhes of air. As the partieles of iron are nearly cight times as heary as water, it was only the alherent air that enablel them to lloat upon tho surface. Closely allical to this adhesion is the remarkable property of condensation which porous bodics,
and especially charenal, exert on gases. Oning to this property of charenal-espectally freshly hurn
 from their watery sulution ly filtration of the latho throush it ; for example. sulpharetted hydropen may lie romovel from water so completely thes it cannot be detected either hy its well-known oulnar of ley the ordinary tests. samsure foum that 1 whme of freshly lamen! bax-woul charemal absorthed !ot velumes of ammonia. S.i of hyivirochlore* acid, (6) of sulphurous ach, $\overline{\mathrm{B}} \mathrm{y}$ of sulphurettent liyituren, 40 of putwile of mitromen. 35 of car

 of earburettel hydrogen, and $1 \%$ of hydrogen. These results fullow an orter rery nearly the same as that of the sululinity of the gases in water.
intenhonse has investigated the differnees in the ahsoment power of different kimes of charenal ; tho following are his most important results: 05 of a gramme of cach kind of charcoal leing cmployed, and the mambers in the table indiating in cubse ecntimetres the quatity of absorhed gas.

| Gas Lised | Sind of Chartonl employed. |  |  |

tips, hut in whers the eyes-always small-are sithato. chsewhere on the heal, ainl a few are dostitnte of eyes. They are helieved to possess the an
senses of taste and smell, amd at least some of them that alsu of hearing, as they not only have a nervens centre analonous to the neonstic division of the brain in vertebrate amimals, but a little sae on eatel side, apmarently an wrant of this sense Wheir uovoons syotem is more comphex amd conemotrated than that of the leanless (armphetons) molluses; the principal nervous masses surrumal the gullet. In the highest (i,. such as sumls, there are only two principal nervous masses, une of which, supplying the nerves commecteal wath sumsation, is called the bram. The bloml of $G$. is often opmbeseent, with a few colourless eorntseles. 'The leart is always systemic only, and in almonst all consists of one iuricle and one rintriclo, althourh a few $G$. lave two arriclos, une for each set of sills. Near the commencement of the anbta, there is often a contractile masenlan swelling (hullus erferiontes), as in lishes. liespiration takes place generally ly mills, which are very varinusly situated, sonetimes exturaally, sumetimes in a special cavity, and exhibit an equally great varioty if form and struc. ture: lout some (ri, as snails amil slugs, have, instead of gills, a pmbmary sate or cavity, lined with a vasenlar net-work, these beine vither inhabitants of the land, or, if of the watir, oblized to come oceasionally to the surface for the purpose of breathing. A few of the lowest (r., douhtently placed in this class, are destitate of distinct respiratory orwans. The digestive apmatus also oxhihits mnch diversity. some of the G . feed on regetahle, some on animal substances, and some of them on animals which they themselvas kill. 'Thus, whilst snails eat leaver and other suft farts of veretables, whelles (Burcinum) prey on other molluses, and are proviled witl a remarlable apmaratus at the end of a probosed intos which the month is elomentenl, for filinir a hole -as nice as conlal lie mate ly the arill of a mechanie-thrmag the harilest shell. The monath of the snail is, in hke manner, admitalsy mapetol to the entting of leaves or similar substances ly the aretinn of the lips against asharphorny plate. Other is. have the muath furmishem with two cuttime hlades, wromght by powerul muscles. The tongme of some is curemil with minute recurved hooks, to prevent the pussibility of inything escaping from the month: and the stomateh of some is a muscular gizzard, puwidenl with cartilaginous or sometimes ealemreous projowtions, or stmmachic teeth, to ajd in the comminution of the forn. The intestine is generally bent hark, su that the anos is mut far from the lowe. The liver is large, as are also the sulivary glames of many axstropuls. Very mreat diversities are fomm in the repmoluctive system. In sume (r., the sexes are distanct (G, Dresea) : others are hermapliromlite ( (i. Movoecta) ; and whilst self-impregmation takes place in some of these, others-as sumils-muturbly impreguate each other liy copulation. In geameral, the reprodnctive oreans are bery laroly ineroloped, and are of complex and remarkable structure. The $G$, are in general oviparons; a few are "roviviparons. The young of winatic $G$. at first swim abont actively by means of riliated fins attached to the hearl. Gi, are generally unsymmptrical, one situ of the boty being developed witlout the other, smuc of the priseipal organs of which-the gills aml nerves-are atrophied; and thus the shelf with which most of them are eovered hreomes, in the greater nmmber, spiral, the spire tammer towards the matrophied side, which is generally the rierht side, although in some (reversed ${ }^{\text {ar }}$ sinastronsal sluells) it is the left. The head and the organ of locomotion are eapatule of leing withdrawn into the last whorl of the shell, and in aquatic sprecies generally, the month of the shell cau be elosed by an operculum (y. v.), exactly fitting

## GASTON DE FOIX-GATESHEAD

it, and attached to the foot, but in which many varicties of beautiful structure are exlibited, and which is generally horny, sometimes calcareons. Some sluels are smiply conital. and there are numer. ous diversties of form. The shell is secreted by the muntle. See Molluscs, SHmins, and UsoAnVEs, The viseera are contained in a thin sae-part of the matle-which fills the upper part of the sholl. The mann of locomotion, called the frot, is in genemal a masedar tise, developed from the vantral surfact: of the buly; sonetimes, as in limpets, capable of ating as a sucker, and exbiniting "ther cem more remarkable monlitications, so that in some it becomes an organ for swimming. G. generally creep ly aneans of this dise adhering to surfaces, and contracting in transverse wrinkles or undulations, which Tegin from lehind. The (i. Eencrally sperete a peculiar kind of slime. Sone of them atso produce other peealiar secretions, of which the Tyrian purple attords an example. it. have a great power of renewing lost parts; tentacles are thus restured. and even the eyes which they bear at their tips, the month with all its apparatus, or the head itself.

GAlZF, it light transparent silken falmie, sup-
 been manafoutured in Gaza, a city of Pralestine. France and switzerland protuce considerable guantitin's of ganze. The chief seats of the manfacture in Crat loritain are Pashey and Glasgow, and the surromblone districts. The openmess of texture is ohtanell by prossing the wary threads between each thened of the weft, so that the weft passes through a shuersion of loops in the warp and the threads :arn than kept apart, withont the liability to sliding frum thir plates, which wouth take place if simple

Weaving were left so loose and ogen. Inferior qualities of gauze are made of a mixture of silk and cottou.

GAV゙A'ZZI, Aifasanden, a popular Italian preacher and reformer, distinguished by his patriotic zeal in promoting the cavil amd religinus puress of his cometry, was horn at Fologna in 1si9. It the early age of 16 , he hecame a monk of the Farmabite ordor, and subsequently was apminted professor of rhetoric at Naples, where he specdily aequised great reputation as an orator. By his meompromisug alvocacy of chureh and stiate reformation, he earned at oner the eathusiastic almaration of the formessive party among his countrymen, aml the litter enmity of the 1 riestly and ruling powers.

On the accession of l'us IX. to the papal chair, G. Was sne of the formmat surpurters of the tiberal policy that mangurated that fontill's reign ; and having repaired to liome, he deroted himself to the difusion of political enlightenment and patriotic aspirations among the masses of the foman proulation. The perve sanctioned his political lahours, and apminted him almoner of a body of 16,060. Fioman troops, who volmanteceld for the canmpign of Lombardy in 1948, and quitted fome tw proceed to Vicenza. To (x.'s fervit and patriotic oratory may be attributed, in no slisht degree, the universal spirit of self-sacrifice evoled throughout ltaly during this period of her history: Ile was called the Pietro Erimide, or Jeter the IIermit of the natimal crnaile. The Foman legion having heen recalled hy the jope, $G$. continued in Florence, Genom, and bindogna, to agitate in favour of the national morement. On the establishment of the republic at lome, he was apmonted atmoner-inwhef to the national army. Under his superiatendence, celterent military hospitals were arganised amd attemded bre a band of Joman ladies. who vohnteced their services and co-operatiom in the care of the woundel. Fome laving fallen, $G$. esurbed to linghand, where he delivered numerons Whresses and lectures, illustrative of the $\mathbf{p}^{\text {olitical }}$ and religions aims of his comntry. Fecent events have mifled him to retum again to Jtaly, and he is whe more the formost of his fellow-conntrymen in the alluneny of the civit and retigines prouress of his mative land. He has for some time completely boken with the papaey, not only in its temporal, hout in its religions aspect: Yet he is not, and does nut wish to be considered as exactly a Irotestant.
 and apmentic christianity, lant is not disposed to acept fur Italy any realy-male theological system from alorond. Hís leading doctrine, however, 'Hnstifieation by Faith.' is apmrently the same, at least in form, as that hed by the reformers of the 16th eentury.
GAVELKIND. Lappenterg, who, thongh a foreigner, when endorsed by his translator Thorpe, may be considered as the very liphest anthority on the subject of English social antiquities, thus speaks of the enstom of gavelkind: I fact worthy of notice is the existence down to recent times of the All Lritish law of successiun in Wales, Kent, and some parts of Northmmberlam, called gavetkind. As far ins we are enabled to understand it, in its mixture with Anglo-Saxon law, all the sons of the father inherited, luat the youngest possessed the humestead; the eldest, or the next following capahe of bearing arms, lad the heriot-that is, the arms offensive and defonsive of his father, and his horse. Even the son of an outlaw could not be deprival of the entire succession, but of the half only' (vol. i. 1, 33 ). Though a Celtic origin is here,

## GAVLAL-GAY.

as by Blackstone (Stcphen, iv. 1. 545), 1, robably with reason, ascribed to this temure, it seems to the the general ophnion of legal antignaries (solden, Analict. 1. 2, e. 7; Stephen, vol. i. 213) that it prevaled over the whole kinghan in Anclo-saxom times, and that in Keut and elswhere it was anmen the 'liberties' which the pople were jurnuitetel to retain at the conquest. Most of the many herivations which have heon surevested for the worl are, morew, r, Teutonic-gif ful cyn, ernivalent to Lurl Coke's ante all hinde, or the enstum which gives to all children alike, bing the sunst probable. In Wales, eavelkim whamed mi-
 llany VIII. ©. 26), and in some parts of England it is not yet aholisherl. In Kent, all lames that have not beeu disqavelled ly act of promment, are held to be gavelkinel-ib fint which songt to in: borne in mind in all transations with Kentish 1wonery. In ahlition to the characturisties of this temure alrealy moticed. Wackatum mentans the following: 'l. The tomat is of arn sutiacient to aticn his eatate by feollment at the age of Iir. 2. The estate dies nut ascheat in einer of an attainder for felony ; their maxim beine, "the father to the bunch, the sin to the fonath." 3 . In mont phates, the tenant ham a power of devisimf bames loy will before the statute authorising the derise of lands gencrably was mate.

 from true crucodiles and from allazatis in the ereat length and shemerness of the mazale. Inother feeculiar character is a large cartilaqimous swelling at the extrenity of the mazee in the males. aromil the oritice of the mostrils. The tweth are vory numerous, alout 120; they are more epmal in size than those of the other animals of this family, although some of the tirxt are rather larger than the rest. the langest of the luwer jaw heing receiven into notehes in the "1mer, as in the true crocedilos. The heal is very hrant, the narrow muzzle bergins abruptly, and in it the lomenes of the bone of the lower jaw are united and prolnged as one. There are twos great perforations in the bones of the skull behind the eyes, extermally marked by depersions.

## Gavial (forvinlis Grengeticus).

The plates which cower the lack and the nape of the neck are mited. The crest of the tail is much elevaterl: the feet are wedned to the extremity of the toes; the whole habits as anuatic as those of the crocodile of the Nile. The only perfectly ascertainen species, G. Ganyticus, inhabits the Ganges. It attains a greater size than any other
of the recent Crocoliliur, frequently attaining the length of 25 feet; but owiag to the slemierness of its muzale, it is estecmerl less dangerms than a true crocolile of smaller size. The form of the muzale stems particolarly to adapt it fur preying on tish. The cartulagimus swelline at the extrimity of the muzale serms to have green risa to filan's statement, that the coneodil, "of the fimuers had a lown at the tijo of its smat. Finsil mials, nifferent frem the existme sucers, have ber 11 fumb in Eocene deposits, as at Bracklesham, in En-laml.

GAVIN゙ANA, w ('AVINANA, a villate of 6 ge inhalitats, pheturesqualy sitatemb anm the Tusean Apmones, in the valley of the river lima, owes its interest to the memorable hattle fomelit around it: walls in 1 bi30, betwon the repmhan fores

debidita Palam ('oryphe (empenga), a fanleaved Iralm, native of the East Indics, and one of the most aseful palms of that part of the world. Its stom yiclds a kium of sam: its rome is neclicinal, heing thoth "mollhent and slightly astringent, so as to lim particularly abapted th many cases of diarrhata: its leaves are nsed fur thatch, for making broul-brimmed hats, and for varions ceonomical

and lags, in the manufacture of whach many of the people of Java find much cmployment ; the tileres of its leaf.stalks are made into ropes, baskets, nets, cloth, se.-To the genus Coryphathelongs also the: Taheat pas ( q . . ) -Tbe fruit of e. Pumas, a Dexican species, is catahle, and las a sweet taste.
 fonnder of the Arahian scheol of cbemistry, flourisloul towards the cind of the Sth, or the eommence. mont of the 9th century. The phace of his birth is merertain. Aecordmy to the majority of amphorities, he was born at Tơs. in Klurassan, but Abulicala sumperts the chims of Marran in Mcsopotamia. We was greatly estermecl in the East, and sulisequently in Firope, where the chemists, down to the time of San Helmont, what nothing more than rejeat his expriments. Cardan reckons (b, me of the twelve sultlest geniuses of the worth, while Roger Baem hestows upon him the equithet rangister manistrorum.' He wrote an immense number of treatises on alchemy, of which a considerable number are extant in the form of latin versions. The Library of deyden contains many mannscripts of G.'s works which have never lecen puldished. In the Imperial Library at Paris there :ate manuscripts of bis two celelriated works, the Summa Collectionis Complementi secretorunh Finture, and the Summa Perfic-tionis-also of : work on Astronomy, and a treatise on Spherical Triangles. The priuciple laid down by (i. at the commencement of his works is, that art cannot imitate mature in all things, but that it ean and ourhit to imitate her as firr as its limits allow. An culition of his works in Latin was published at Dantzic in 1652, and another in English by Linsscll (London, 1678). For information respeeting G.'s ipinions with regarl to atchemy, sec Alciemy.
GECKO (Gecko), a gemus if Saurian reptiles, constituting a family, Gcolotider, which some recent naturalists have divided into many genera. The geckus are uf small size, and generally of repulsive aspect : the colnors of hant of thim are dull, and

## (iccko (Platydactylus homalocephalus):

1. Font of P. Cepedianus ; 2. Yoot of P. Hnsselquistii; 3. Foos of P. Lemehanus: 4. Claw of Gymnodactyms pulchellus 5. Font of Thecadactylus theconsx; 6. Foot of Gymnodactylug scaber.
the small granular scales with which they are coverel are in geueral mingled with tubercles. The legs are short, the gait ushally shaw, measured, and stealthy, althongh geckos can also run very nimbly when langer presses, and often disaynear very suldenly when they seem alnost to be struck or
eanght. The fect are remarkable, being adapited for adbering to snuoth surfaces, so that geckos really climb the smonthest trees or walls, or creep, inverted on ceilings, or hang on the lower side of the large leaves in which tropical regetation abounds. The hody and tail are never crestel, Jut are sometimes furnisherl with lateral membranes, variously festonned or fringet. The lateral membrane is sometimes even so large as to lue of use to arboreal sincios in enabling them to take lune leaps from branch to brauch. The geckos feed elnetly on ins.ects. Thes are more or less nocturnal in their labits. They are natives of wam climates, and are very widely distriluted over the werlh. Two species are fomma in the south of Eurene, tooth of which frequently enter houses, as do the geckos of Eerpt. India, and ,ther warm countries. The nanc (i. is derived from a pecidiar cry often uttered loy some of the species, and which in some of them resembles syllables distmetly prononnced, whilst uthers are described as enlivening the night in tromal forests by a harsh cackle. The geckos havi, bi almost all parts of the world where they are found, a hal reputation as venomous, and as impartine injurious gualities to fool which they tonch, but there is no gooll evilence in sumport of any such opmion, in accordance with which, however, an Egyitian G. is even known as the futher of terosy.

GEDDES, Alexander, LL.D., a biblical critic, tramslator, and miscellaneous writer, was forn at Arradowl, in the parish of Ruthven, Bumfshire, in 1737. Ilis parents were Roman Catholics, and young G. was eincated for a priest, hirst at Soulan, a monastic seminary in the fighlands, and subsequently at the Scots College, Paris, where he acquired a knowledge of Hebrew, Greek, Italian, French, Spanish, German, and Low Dutch. In IFG4, he returned to Scotland, and, having taken orders, he was appointed offiating priest to the Roman Catholies of Angus, but after a short time went to resile with the Earl of Traquair. In 1769, he undertook the charge of a Roman Catholic congregation at Auchinhalrig, in Banffshire, where he remained for ten years, making himselif during that period honourally conspienous by his charities and extraordinary liberality of sentiment. He was at length deposed from all his ecclesiastical functions, on account of his oceasional attendance at the jarish charch of cullen, between the minister of which and himseli there existed an intimate acquaintance. G, now resolved to hetake himself to literature, and proceedel to London in 1780 . The had long plamed a translation of the Bible into English for the use of Roman Catholics, and he was nuw, through the muniticence of Lord Petre, enabled to devote himself to the work. After various preliminary lublications intenled to pare the way for an impartial or favourahle consideration of his moynum opus, there apluared in 1792 The First lolume of the Holy Bihle, or the Book accounted sucral by Jews and Christians, otherwise called the Books of the Old and Jew Covenants, fuithjully translated from Corrected Texts of the Originals, with Various head. ings, Explunatory Fotes, and Critical Remarks. In 1793, the second volume was publishel, carrying the tramslation as far as the end of the historical books; and in 1800, a third volume was issued. contaimur his Critical Remarks on the Hebrow Scioptures. The opinions enunciated in these volumes, esprecially in the last, are startlingly heretical, more especially when the training of their author is considered, and were calculated, at the time of their appearance, to offend both Catholics and Protestants. They exhibit as thorough-going liationalism as is to be found in Eichhorn or Paulus. Moses is said to be inspired in the same sense as other good
men; and in recrarl to his purpose, it is affinued that "he only did what all other accient legislatiors had dome-reguirel a greater or less degree of implieit wherience to their respective laws, and for that furpose feignell an interconse with the Deity, to make that uledience more palatalile to the erednions multitule.' Miracles are exphinct away : and the account of the ereation in (renesis is lescribeel as a most leantiful mythos or fhilosonhical fiction, contrivert with ereat wisdrom, and dresseal up in the garb of real history:. Thuse niminns naturally emongh expused him to the charge of infilehty. and his ariticisms were deseribed as ' 1 -ss seurrious, prohap, but not less impious than thone of 'llamas t'ane:' All sorts of ecelesiastics unated in their combinnation, and the undoulted thent of their hasthity was to crush whatever hopes of liturary fane fi, may have entertainel. He diel at lombon, 2lith Feloruary 1 swe. It is now generally abmitted, even by thuse who have no symatly with his views, that G.'s translation is in the main exeellent, and that his rmarks are oiten valualle. Hlis lalours have umqustionably alvanced the science of Billical "riticism. Among his other promuctions may le mentioned a poen on the Confosional; the Buittle of $B-n g-r$, or the Churcles Triumith, a comic-hroic poon in nine cantos; and Iberdomucha, or the Buttle of the Bards.

GEDDES, JaNET, known in Scottish acelesiastical history as 'Jenny Geddes,' lias had her name transmittel as the person who took a prominent lart in resisting the introduction of the liturgy or Service-bork into the C'hurch of Scotland in 16:37. The circumstances were these. Sunday, 231 July 1637, was the day tixed for this innovation, so obnoxious to the Scotish Preslonterims. and an immense crowd filled the High church of St Giles's, Elinlurgh, on the occasion. On the Dean of Edimburgh begimning to reah, his voice was lost in a tumultuous shout, and an old woman, said to have been one Jenny Gr, who kept a greenstall in the High Street, bawling mat: 'Villain! dost thou say mass at my ligg' (that is, ear). launched her stoml at the dean's head. Cniwersal confusion ensued, and the dean, throwing off his surplice. Hel, to save his life. The Bishop of Elinhurgh, on attempting to alpease the starm, was assabled hy a whley of sticks, stones, and other missilus, accompanied hy cries ami thrents that effortually sileneen him. This tumalt proved the deathbum of the liturey in scotland. It has heen donlited, however, if there ever was such a purson as Immy Ciedules. In lank a citizen of Edinhoryh, of the name of Conert Mein (who died in 17 (i). known for his exertons for the iompownent of his mative city, published a tract called The ('ross Ripmavel, Prelucy and Putronage Disprornl, \&c., in which be claims the exploit of Jenny fi, for his great-grandmother, 'the worthy Barhara Hamilton, spouse to. Iohn Mein, merchant and postmaster in Elinburgh, who, in the year 163, spuke upenly in the charch at Edinburgh against Archbishop Land's new Service-hook, at its first reading there, which stolped their proceetings, an! dismissed their mectage, so that it never obtained in our church to this day.' In the obituary notice of Hobert Mein, Weeky Maqazine, vol. xxxix, and Scots Mayazine. vol. xxxi. ( 776 ), this liarhara llamilton is said to have been descended from the Ifamiltons of Bardowie, ' but was better known in our history by the name of Jemy Geddes, though called so erroneously.' Jenny G.'s famous stool is said to have been hurned by herself in the bontires at the cross of Ediaburgh at the Festoration, and what has been called hers in the Dluseum of the Society of Antiqnaries at Edinhurgh, has no claina

GEHENNA is the Greek form of the Thehrew (ie.hinnom ( Valley of Ilinmom ), or (re-ben-Hinnom (Vatley of the kion of Itimnom'). This valley, or rather forge-for it is Aescribel as very marrow, with stecp and rocky silles-lies south and west of the city of Jerusalen. Here Sulmon built a high Ilace for Nobch ( 1 Kings xi. 7), and, in fact, (G. wonld alpear to have loceme a favourite spot with the later Jewish lings fur the colemation uf indatrons rites. It was here that $\lambda$ lazz and Alansseh made their childjen pass throuwh the fise" 'acerrling to the alomination of the heathen:' and at its sonth-east extremity, slecifieally designatel Tophet ("place of haring'), the histeons practice of infant sacrifice to the fire-gods was int muknown (Jeremiah vii. :31). When King losi:la cance finwoud as the restorer of the ohl and pure national faith, he 'defiled' the Valley of Himmon by covering it with homan lumes, amil after this it aprears to lave hecome the common cesspool of the eity, intu whimh its sewage was condneted, to be carricil ofl by the waters of the Kidron, as well as a liystall, where all its solin filth was collueted. llomer, it hecame a have best of insects, whose laryon "woms" fattencl on the compution.' It is also sail that fires were kelat constantly hurning hem, to consmme the bodics of criminals, the carcasses of animals, and whaterer other oflal miyht for combustille. Among the later Jows, (t. and Thynet came to be ruarded as symbuls of hell and tomment, and in this sense the former worl is frembently cmpleyed hay Soviour in the New 'Testammit. For example, in M1ark ix, 47, 48, he says: - It is luater for thee to enter into the kingdinn of com with une eye, than havine two eyes, to
be east into hell-fire [Gehenna]; where their worm dictl not, and the fire is not quenched.'

GEIBEL, Fmanuel, one of the most popular of the living puets of Germany, was born at Liblecel, on the 18th Octaber 1815. After receiviag the ruliments of education at the hith sehool if his tative town, he compled his stulies at the university of Bomn. In 18:36, he went to Berlin, where lue became acquainted with ('hamisso, Gauly, anel Kuyler. 'Two years afterwards, be ohtitined a tutorship in the family of the Russian ambassalor at Athens, where he contimued to prosecute his scientifie and pretical studies. On his retum to Lialneck in 1sto. he workel up, the material he had collected in (ireece, and becane, in addition, a diligent student of Italian and Spanish literature. Som after the puldication of his tirst poems, a pension of 3 : thalers a year was bestowed upen him liy the king of Prussia, (i. now resided alternately at it Cioar on the Thine with Freiligrath, at Stuttgart. Hanover, l'erliu, and Libbeck ; till, in the sprins of 18.5, he was appointel professor of astheties in the umiversity of Munich lyy the king of Bavarib. In conjunction with Curtius, he pminished his chassinglue Sudion (13mm, 1St1), containing translations from the Creck poets. These were follawed in the same year by his redichte (berlin, 1840, 2sth mit. 15i2), the melody, artistic beanty, and decidedly religions tone of which, made them at once ereat farourites with the Germans. The resnits of his Spanish sturlies were the ripunisclen Volkstiedry and homanzon (Rerlin, $181: i$, which wer followed by the Spranische Lied rowh (Berlin. 18.2), phlished in conjunction with Paul lleyse. In 15.5 appeared his tragedy of Franehildo. llis poems are distinguished hy forvom and truth of feeling, richness of fancy, and a certain pensive melancholy, and have procured him a popularity-especially among cultivated women-such as mo port of (iermany hats enjored since the days of Chland.

Geiger, Abrama, rabhi in Brestan, was bom at Frankirt-on the-Maine, Mlay 24 , 1810. Accorining to eld rabbinieal practice, bis teachers were his father aud dder brother, till he reached the age of cleven. After that, having received a more regular education fur some years, he went, in 1829 , the the miversity of Heideliberg, and shortly afterwards to that of liomn. While engared there in the study of philusuphy and of the Oriental langunges, he gained a prize fir an essay on the Jewish sources of the Komon, which at a later period apparel in print under the title. Wus hat Moharnmal aus dem Judenthum aufionommen? (bonn, 1833). In Novenber 18:2, be was called as rabbi to Wiesbulen, and there, under the impulse to the scientific sturly of Judaism which proceedel from berlin, he devited himself zealously to Jewish theology, especially in its relation to practical life. In $183 \overline{3}$, he joined with several ahle men in enliting the Zuitscleritt fiir Jülivehe Theolofit, The spirit of inguiry, however, with which he discussed prevalent mpions and usages, brought him into collision with the conservative Jews, especially atter 1s:3, when he becane assessor of the rabbinate at breslan; lat the ereat majority of culuated men in the sect comtimmed attached to him. It was he who gave the tirst impulse to the coldorated assemblies of the rablus, three of which have been held sinee 1844 at liruswick, Frankfurt-on-the-Maine, and Gresku. At the second of these he was vice-president, and presilent at the third. Thongh (i. thus took an active part in the reform morement, he could not alnadon his historical point of riew, which made him unwilling to break entirely with the past ; and therefore he refused a call to be preacher to the

198

Perlin Reform Society. Besides sermons, pamphlets, and aumerous contributions to the above-mentioned pariutical, ?. published sume historical monographs, which are distinguishel $1, y$ thoroughness of inveatigation and many-sideal learning. Among these may be mentioned the Melo Cheofadim (1serlm, 1s40), on Joseph Salomo deJ Jedigo, aml the Mite J Femanamin (Berlin, 1547), on the exssetical schond of Northern France. His Latir- and Lexthuch aur Sprache des $1 /$ inchere ( 18 [.) also is of great value to the Oriental philologist. In 1550 appeares the first number of Stulion on Moses-hen-Maimon ; and in 1851, a translation of the Diven of the 'astilian Abu'l' Hasson, Juche hed-Lexi, accompanicd ly a biography of the poct ami explinatory remarks. besides sume ipecimens of Jewish medieval apologeties, cuntributed to Breslaner's Juhthech in 1551-1852, (i. has more recently $\mathrm{m}^{\text {mblished }}$ a work on the wirinal text, and the trauslations of the lible in their thendence on the development of Jubaism (Irscheitt und Ceburstantigen der libhel in ihrer Abhangigheit rm dir inneren Entuickelung des Judenthnus., Ireslan, 185\%).

GEILER VOA KMISERSDERG, Jomds, a famus pulpit-rator of Gemany, was bone at Schatilhausen, 16th March 145:5; sturlicd at Freiburg and lisel, whet he ohtained his degree of D.D.; and in 11:8 beame preacher in the cathedral of Strashurg, where he died, 10th March 1510. G. ranks anony the most learnul and original men of his age. His sermons, usually composed in Latin and delivered in German, are marked by great eloquence and caruestness; nor clu they disdain the aids of wit, sarcasm, aml riblicule. Vivid pictures of life, warmth of feeling, and a bold, even rough murality, are their leading characteristics. In fact, G.'s ethical zeal oiten urged him to a pungency of sative harily in keepung with modern riews of the dignity of the lulpit, font quite comgruons with the taste of his own age. IIs style is vigorous, free, ami lively, and in many respects he may be regarden as a sort of predecessor of Abraham a smeta-Clara. Oi his writings, which have now become very rare, may be mentioned Farrenschiff (Lat., Strash. 1.511; Ger ly l'auli, 1520), comprising 412 scmons nu Sehastian Prandt's (q. v.) Farren-
 Porulitw (Ntrash. 1510) ; Detw Sohif dor Pomitenz whl Duswethang (Augsh. 1511); Jans Burh Gran-

 (Nitrasb. 1515); and Dus Buch Jon süunden des Mundes (Strast, 1515). C'ompare Ammon's ('. Fon Kaiservberg's Lotien, Lehron und Prodighon (Erl. 1820), and DLeck's Iolt. (': Von Koiserwort. Se'n Lehren und Scone schrigton in oiner Ausucal (3 vols.,

(iEJEL, Enic Gustaf, one of the most distinmuishel historians of sweden, was bern at Jiansitter, in the swedish len of Wermlanti, in 1783. He was sent, at the age of 16 , to the miversity of Epsala: and in 1 sos he competed successfuily for the prize which was that yoar awaried ly the Academy of stockhom for the lest essay on the life and character of the ereat Swedish administratur, stem sture. This was the turnineremint of his lifu, firt from this period he logan to derute bimedy with zealous industry to the study of the history of his native comntry: 1 lis assidluity was rewarded by his specdy nomination to a post in the Chamber of the National Archives, amp in 1810 he was electel assistant to Fiunt, the jrofessor of history in the miversity of [pala, and in 181\%, on the death of the latter, he suseceded to his chair. G.'s early lectures were listenerl to with the
profoundest interest, buth by his students and the public at large, who erowdet to his lectureroom; lut at a subsegnent perion of his temching, his Inpularity diminished in proportion to the increased profumbity of his views: While the suspicion that he harkmared sceptical notions in resard to thee Trinity, brought him into disfavour witla a certain Fartum of the community. These suspicions led to his thonuciation to the university anthorities: but the exmmination to which the charges ebainst him gave rise termimated in his acquittal. and were even followed by the otier of a bishopric, whith. however, he meclinet. (i. exercised it marked inflnence on the poetie no less than the historical literature of siwelen, and according to the testimony of his conutrymen, his sistet skeleden, J"ikingen, odallomden, an! other hervie pieces, phace hin in the foremost rank of swellish pocts. He aml his friemls Adlerbeth, 'Tegrer, and Nikander, adhered to the 'Gothic' school of poetry, which owed its origin to 'the Sonetety of the Coths,' which they an! several of their friends estallishonl as carly as 1810 , when they brought out in connection with it it magazine entitled the Ihunc, in which first apmeared several of $G$.'s best poems, and among other promue: tions of merit, the early cantos of Terner's frithiof. Grait as is the value of G.'s historical works, he unfortunately did mot complete any one of the vast undertakings which he planned. Thlus, for instance, of the Suea Mikes Muifucr, or liecords of Sweden, which were to have embracel the history of his native country from mythical ages to the present time, he finished only the introbuctory bolume. H is next great work, Stenske Folkets: IIsturia, which was intemded to form one of the series of European histories, edited by Leo and Tekert, was not carried beyond the death of Queen Christina; yet ineomplete as they are, these works rank inonir the most valuable contributions tuswealish history. To G. was intrusted the task of examining and editing the papers whieh Gustavus ITI. had lequathod to the university of Upsala, with the stipulation that they were not to lhe opened for fifty years after his death. In fullilment of his charge, (i. arranged these papers in a work, which appeared in 1543 inder the title of Gustof 11 .'s cherlemnader Papler, and which, from the worthless nature of the contents, disappointel the expectations of the nation, who had leen led to hope that their publication would reveal state scercts of importance. During the last ten years of his life, G. took an active part in polities; but although his political writings possess great merit, the very versatility of his powers diverted him from aplying them methonlically to the complete elaboration of any one great olject. G. was known to his countrymen as a musician and composer of no mean orler. He livel on terms of friendly intereourse with Bernalotte, and his numerons letters to the king form part of the samlade skrifter, or collective works, which have been published since his death hy his son, who has apruended to this chition, whieli was completen in 185:3, an interesting biographical sketch of his ristinguished father. G. died in 1847.

GELAA, in ancient times, a sery important town, on the southern coast of Sicily, on the river of the same name. It was foumled by a Rhorlian and Cretinn eolony, 690 в. $c$. Its rapul prosperity may lee inferred from the circunstance, that as early as the year 5S2 1:. C., Agrigentum was founded ly a colony from Gela. After Cheander had made himself tyrant in the year $\mathbf{3} 5 \mathrm{~s}$ B. C., the colony reached its lif hest gitch of pwwer unker his brother Hipmoerates, whe sublum almust the whole of Sially, with the - xeptinn of Syrachse. Cielon, the stacessor of llip["Mrates, pursiod the same carcer of eonquest, and

Syracuse itself fell into his lands, and was even made his prineipal residence, $($. being committel to the government of his brother llicro. Aiter many vicis. situles during the Corthaginian wars in Sielly, it ultimately fell into decay. Its ruin was completem? ly Phintias, tyrant of Arrigentum, who, a little bifure 280 r. C., removed the inhalitants to a town in the neighbourlanu, which lie liad founded, and to which he gave his own nitme. Its site is generally helievel to be oceupicd by "lempa Nova, at the mouth of the river now known is Fiume di Terranora.
Gbiatigenous thssues and geima. TlNE. The gelatigenons tissues are substances resembling the proteine-bodies (albumen, fibrine, and caseine) in containing carbon, hydroges, nitrogen, oxygen, and sulphur ; but differing from then in containing more mitrogen ant less carhon and sulphur. They consist of two primeipal varjeties, viz, those which yield glnten (or ordinary gelatine) and those which yieh chondrine.
Gluten is oltained by more or less prolonged boiling with water, from the organic matter of bone (the osseine of Fremy), from tendons, skin, cellular tissue, white fibrous tissue, the air-hadder and scales of dishes, calves' feet, lartshorn, \&c.; while chondrine is similarly olstained from the perinanent eartilages, from bone-cartilage lefore ossification, from enchondromatous tumours, \&e.

Neither gluten nor chondrine appears to exist as such in the animal body, but is in all cases the result of the prolonged action of boiling water on the above-named tissues. Frémy's analyses (sce his Recherches Chimiques sur les $O$ s, in the Ann. de Chim. et de Phys., 1555, yol. xliiio, p. 51) shew that osseine is isomeric with the gluten which it yields, and further, that the amount of gluten is precisely the same as that of the osseine which yichs it.

The following talle exhibits the composition of osseine and the glaten yielded by it as determineld by Fremy, and that of chondrine as determined ly Mnder:
rarhon.

Gluten, when perfectly pure and dry, is a tough, translucent, nearly colourless substanee, devoid of odour and taste. It swells when placed in coll water, anel loses its translucency; but in hoiling water it dissolves, atm forms a viscid fluid, which on eooling forms a jelly. A watery solution containing only 1 per cent. of gluten, gelatinises on cooling. This property is destroyed both by very prolonged boiling and by the aetion of concentrated acetic acid. Gluten is insoluble in alcuhol and in ether.

A solution of gluten is abundantly precipitated by solutions of corrosive sublimate and of bichloride of platinum, as well as by infusion of galls, of which the active principle is tannin or tannic acid (the terms being synonymons). Tannic acid produces, even in very dilute solutions, a copious yellow or buff-coloured precipitate of tannate of gluten. The gelatigenous tissues unite in a similar manner with tamin ; they extract it from its watery solutions, and form compounds with it which resist the action of putrefaction. It is thus that hieles are converted into Leather (q. r.). The tests which we have mentioned also precipitate allumen, but gluten may bo distinguished from allumen by its not being thrown down (as is the case with albumen) by the addition of ferro-cyanide of potassium torgether with a little aectic acial. The gelatinising property also serves to distinguish gluten when it anonnts to 1 per cent. ur more of the solution.
On exposure to the atmosphere, gluten becomes
more rapidy $]$ intrid than almost any other animal substance. Under the influence of oxydising agents, it yields the same products as the proteine-bodies; treated with the mineral acids or with alkalies, it yields Glycocine ( $\mathrm{f} . \mathrm{r}$ )-known also as glycine, glyeocoll, and sugar of gelatine-Leucine (q. v.), and other products.

Isinglass, which is prepared from the air-hadeler of the sturgeon, \&c., when boiled with water, furnishes gluten in a nearly pure state. Glue ancl size are two well known forms of impure gluten or sclatime.

Chonlrine resembles ghten in its physical propertics, and especially in its property of gelatinising. It differs, however, slightly from it in chemical composition (see the above table), and in its behaviour towards reagents. For instance, acetic acid, alum, and the ordinary metallic salts of silver, corpuer, lead, \&c., which produce no apparent effect on a solution of gluten, throw down a precipitate from a solution of chondrine; while, on the other hand, corrusive sublimate, which precipitates gluten freely, merely induces a turbidity in a solution of choudine.

We do not know much regarding the physiolugical relations of these substances. Gluten faccording to Shercr) usually exists in the juice of the spleca. lut in no other part of the healthy animal boly; it is sometimes found in the blood in cases of lencocythemia, in [us, and in the expressed juice of caicerous tumours. Chondrine hats been found in pus. The gelatigenous tissues rank low in the scale of organisation, and their uses are almost entirely of a physical character. Thus they form strong points of connection for muscles (the tendons), they moderate shocks by their elasticity (the cartilages), they protect the boly from rapill changes of temperature by their bal conducting lower (the skin), and they are of service through their transparency (the cornea).

GELATINE, in Technolog: This term, although usually applied to only whe varicty of the substance, obtained by dissolving the soluble portion of the gelatinons tissues of aumals, nevertheless properly lielongs also to lsmglass and GlCE, which are motitications of the same material. Vegetable jelly is also analogens, and will be mentioned under this head.

Gelatine and glue signify the more or less pure and carefully prepared jelly of mammalian anmals, lut the term isinglass is only aplied to certain gelatinous parts of fishes, which from their excecding richness in gelatine, are usually merely dried and used without any other prepration than that of minute division for the purpose of faclitating their action.
(ielames (proper) is prepared for commercial Jurposes from a variety of animal substanees, lint chiefly from the soiter parts of the biles of oxen and calves and the slins of sheep, such as the thin portion which covers the belly, the ears, \&c. ; also from bones and other parts of animals.

One of the best, if not the best of the varieties of gelatine manufactured in Great Britain, is that made by Messrs Cox of Gorgie, near Edinburgh, which is remarkable for its great purity and strength, or gelatinising power; they call it 'sparklins ${ }^{1}$ gelatine from its beautiful bright tausparency, and its purification is effected by certain processes which they have patented. The materials they nse are carefully selected portions of ox and calf hides. Another preparation, made by Mr Mackay of Edinburgh (pharmaceutical chemist), is deserving of special mention, as it is prepared with the greatest care from calves'feet, and is especially adajited for invalids. It is made on a limited scale, and only for a few leading chemists.

The general method adopted with skin-parings or hide-chipings, is tirst to wash the pieces very care. fully; they are then cut intu small pieces and placed in a weak solution of canstic soda for a week or ten clays, the solution being kept moderately warm by means of steam-pipes. When this process of digestion has leen sutficiently carried on, the pieces of skin are then removed into an alir-tight chamber lined with cement, and hare they are kelt for a time, determined according to the skill of the mannfacturer and the kind of material employed, at a temperature of $70^{\circ} \mathrm{F}$. They are next transferred to revolvine cylinders suppheal with an almandance of clean cold water, and afterwards are phaced still wet in another chamber lined with wool, in which they are heached and purified by exposime to the fumes of luming sulphur ; they next recenve thein final washing with coll water, which remowes the sulphurous acid. The next oleration is to squecze them as dry as possible, and transfer them to the gelatinising pots, which are lare earthen ressels, ucloseal in wooden cases, made steam-tight. Water is poured in with the pieces, and kept at a ligh temperature ly means of the steam in the cases surrounding the pots.

By this means the gelatine is quite dissolved out of the skin, and is strained off whilst still hot; it is poured ont in thin layers, which as soon as they are sufficiently cooled and consolidated, are chit into small plates, usually oblong, and laid on nets, stretched horizontally, to dre. The cross-markings observable on the plates of gelatine, in the shops, are the marks left by the mesties of the nets.

Another frocess, introduced by Mr swinehume, consists in treating pieces of calf-skin by water alone, without the sola and sulphur processes: the pieces, after simple washing, being transierred at once to the pots to be acted nron ly the steam ; undoubtedly, this is the purest, lunt the exjease of preparing it prevents its general use. Inferior gelatine is made from bones and other parts ui animals, and it was stated by an eminent anthority, that in Paris the enormons number of rats whieh are cocasimally leilled in the sewers and abattoirs. after beiug deprised of their skins, which are resersed for other Imploses, are all nsed by the gelatine-makers. 'These materials are phacel in eages of wire, which are placed in stem-tight boxes, where they are submitted to the direct action of steam of $223^{\circ} \mathrm{F}$.. but at a low $\mathrm{p}^{\text {ressure } \text {; amd cold }}$ water, supplied by another jipe throngh the uluer part of the hox, is allowed to how slowly and Iercolate through the contents of the cage, the water and condensed steam descend to the bottom charped with qelatine, and are drawn of by a stopcock placed there for the purpose.

The French manufacturers succeed better than any uthers in clarifying these inferior gelatines, and they rarely make any others; they mun their plates ont very thin, which gives them greater transpareucy aud apparent freedom from colour ; and they colour them with must brilliant colours, and form very fine-rolled sheets, tempting the eye with an appearance of great delicacy and purity, which would at once disalpear if the material were made up into the thicker plates of the British manufacturers.

The purity of gelatine may be very easily tested ; thus: pour upon dry gelatine a small quantity of hoiling water, if fure it will form a thickish gluey colourless solution, free from smell ; lut if made of impure materials, it will give off a very offeusive odour, and have a yellow gluey consistency. No article manufactured requires snch carcful selection of material and such nice and cleanly manipulation to insure a good marketable character; and those

Besides these now well-known wommereial varieties, athers are occasimally met with, as the Manillir, in thin cakes; the fortu, which is the most remarkable of all, resmbling grapes of a reldish-hown colour, erowing from i straisht thick stem; these are tha dried ova of the sholds giges, a large tish common in the months of the Amazon. An inferior kind is also made of col-sommes and sole-skins, sulficiently gornl, hawever, tol be used in dining beer and wher liguids.

The of the gnalitios of solatine is its power to form chemical combinations with ereran organe mattore: hemere when it is mix.el and dissolved in a drad contaming such matters, it combines, and the compunal is jrecipitated. It would appear

* So ralled from the bladder being yatposely bent into the form it as stupte in drying.
that this eombination, lowewer, is threablike in its arrann mant, amb that the crossing threals furm a time not-work through the flat, which, in fitl. ine, vorries down all thatime sulstances, whelh, loy
 its \&reat valum in elarifyins luer and other liguils. Fun thas reason isinglass, whieh has been found the lest genatine for the prumone, is very largely consumed ley lirewers.

Isinglass, strictly sueaking, is not gelatine, but its only value is from the "xeessive bromertion of pelatine held in the tisulues of the arean whieh yichels it, greatly enhamoel hy the cose with which it is alistracterl from the membrame when compared with the complieatel brocess meessary for seprationg and profomis the melatine from the skins, de., of other anmals. When soparateng, however, the substaness are identieal in comprosition, aml, if pure, are molistinguishallo from cach otler.
besiles the subatanes mentioned as yielding grlatine, formorly harthorn shasings were used, ame ivory turnings aml saw-dust are still cm floyed, hath, however, diedy for alietetic pmores for invalids: and various kinds of anmal fomb we valued for the abomblance of gelatine they eontain, as the Tropang and lbeche de Der (spucies of llolothuria), sharks' ins, fish-maws, ray-skins, Mephant lide, rhinoceros hide, and the softer phrts, all of which are luxuries amongst the chinese, Japanese, Nimmese, Jalays, \&e. Turtle-shells, or the upper and lower parts of the shicld (corapace ame plustron), constitute the callipash and callipee of the epicure, and form, in the hame of the experinuced eonk, a rich melatinous soup. The fleshy parts of the turtle, calves' heal and feet, and many other thimgs, might le emmacraterl as valuathe, chietly in consefuence of their richuess in this material.

GheE differs only from grlefine in the care taken in its manfanture, inn in the selection of the materials from which it is male; almost esery anmal substance will yjell it, lucuce all kinds of animal refuse fimes then way to the glue-makers' boilers. Siverthrless, the impossibility of preservine, for any lensth of time, the materials required fur this manufacture, renders it necessary to aloft some system in choosing and preserving them, until sullicient puantities are collected, without fermentation or lecomposition. Hunce the refase of tanneries, eonsisting of the elipings of hides, hoofs, ear and tail pieces of $0 x$, calf, and sheep are preferred, hecause they can be dressed with lime, which removes the hair, and acts as an antiseptic. For this purpose, they are placed in tanks with quicklime and water for two or three wecks, during which the lime is several times renewed, and the pieces frequently turned over. "Jhey are afterwards washed and iried, and are ready for use ly the glue-naker, who usually gives them another slight Cimerlressing, and subsequently washes them ; they are afterwarts exposed to the action of the air fur a time, to neutralise the catustic lime. When well-drained, the pieces are placed in flat-bottomed colprer-boilers, whinell lave a perforated false bottom waced a little astance abore the true one, to prebent the lmrning of the materials, and which have been supplied with rain or other soft water up to two-thirds the depth of the boiler, the pieces being piled ul, to some height above the top of the open boiler. The whole is kept at a gentle boiling heat until all the gelatinous part has dissolved out, and the mass of material has sma lown into the thid. The boiling is sustained until, ly repeated trials of small puantities, the operator knows the flud is of the right eonsisteney, when it is drawn off carefully into the congealing boxes, and fresh

## GELDERLAND-GELLERT

materials are adned to the residue left lohimd in the boiler, and the process is repeatent.

The consealing boxes are of wood, and are nearly square, being shightly narrower at the loftom than the top; they are filled to the brim, and when their contents are sufficiently solinified, the glue, with a little management, turns out in the form of a cube, which is cut into thin slices lyy a wire in the same manner as soap; and these larger slices are subdivided into smaller cakes by a wot knife. Frames, with nets stretched upon them, are provided for drying the cakes upon; and these frames, when covered with the cakes of glue, are aljusted une over another at a little dintance apart, suphorted letween four uprights, and if in the open air, covered over with little womlent roofs, the whole being arranged so that the air can have free access to facilitate drying. This process is an anxious ome to the manufacturer, as the changes of the weather lave great and often eompletely destruetive effects ufon glue in this state : and in this country only the syring and the autumn can be reliell upon with any satisfaction. Generally, after the open air drying, the glue is taken to drying-roms heated slightly, where it hardens cilectually; but it is not yet finished; the cakes at this stage have a duh, unsightly look, to remely which they are dipped into cold water, or are wetted with a lerash dipped in hot water, and re-tried, this wetting giving the cakes a lright yarnished apparance. (ireat Britain does not exed in the manufacture of glue, and Pritish workmen usnally 1 refer the dark Varicty. Very snperior glue is male ly tho Dutch and Germans, by whom the light and more carefully made yarietius are most $1^{\text {nized, the athesive }}$ qualities being lessened exactly in propertion to the impurities present in the material.
Besides its nse in joinery, eabinet-making, and similar operations, glue is used hy par-makers and in dressing silks; and for these last two jurposes fine light-coloured linds in thin cakes are made. Large quantities are employen also by paper-hangers and uthers for sizing walls in the state called size, which is the glue simply gelatinised after boiling in the first process. i very fine and pure white size is made by the bometmakers of Bedfordshire and other phaces of the skins of calves' head, ears, and the under part of the neck and belly: this is used for stitheming straw, cottom, hurse-hair, and other plaits for making bunets and hats.
Veqetable deliy, which is analogous to ammal gelatine, is olitained largely from some fruits, lout never in a pure statr. ; it is only of value in preserving such parts of the fruit for culinary purposes; lut several of the sea-weeds yidn a large quantity of very pure jelly, which, in some instances, is applied to inportant purposes: thus, the jelly of fitcus spimosus, the agar-agar, or agal-agal, abnulant on the shores of the eastern seas, is used by the East Himians, Cingalese, and Chinese for dressing their silks; the Chinese also ingenionsly form thin films of the jelly over a framework of hamboo, and thus nlake small windows for their houses. This, and another, Ciracilloria lichomoides, are formed into a thick jelly, with sugar and other materials, and caten as a delicacy: ami both are supposed to supply the material for thase womerful birds'mests, which constitute the most costly luxury known to the art of cooking. Another jelly-yielding sea-weed is fomm on our own shores, called the Irish Moss or ("arriseen (Chondrus (rispus), which is often made into jellies for imalids, and the plant itself, on accomnt of its richness in this material, is very extensively employed in feching cattle, especially in England.

GELDERLAND, a province of Itolland, is situated between the Finillor Zee on the northWest, and the Prussian dominions on the sonthcast. It has an area of $1!94$ square miles, and
 chiefly ly the Y"ssel, the lhime, the Waal, mad the Maas. The surface is in general flat, but morthward from Aruheim, the capital, and urer the whole of the north-west partimn of the prowince, stretch samly hills, frequatly covered with lushes. The climate is healthy, amb the soil, on the whole, gond, though much of it is still in leath and marsh. Along the river valieys a rich loamy son is found. Aericulture is prosecuted with great success. Wheat, rye, buckwheat, tohaceo, de., are almodantly proluced. Amons the manufactures, japer aud leather are the principal. Clanf towns, fruhcim, Nimeguen, and \%utphen.
GELI'tiltM, a gemus of Alyer (sea-wemls), uf the sub-order 'eremineror, somes of the slecies of which are believed to atlord the material used by certain species of swallow in building the dible nests so much frized by the Chinese. Nee Nests, Smble. Reveral species of gelidim are used as fond in the east. Like miny other sea-weeds of this urder, they are almost entirely gelatinous, and when boiled with condiments to give Iungeney aml flavour, form a very wholesome and agrecable focid.
(ikLL, Air William, knight, an eminent anti(fuariau and classical scholar, the younger son of lhilip Gell, Esif of 1 Loptom, 1 erbyshire, was hurn in 172. He was educated at Jesus College Caulritye, where he graduated as B.A. in 1798, and M. A. in 150t, and was for sometime a fellow of bmmanuel College in that university. He elevoted his time primeinally to antiquarian research and geographical studies, and phblishen the following learned and valualle works: The Toporray thy Tron (1silt, folio); The (trography and Autiantition of ltheta (190s, fto);
 of the Morcte (1817, swa); Allicie (1817, follio); Pompeiunt. or Obse cration. upon the Toperaruly? Eilifices, und Donaments of Pomprii- in comjunction with J. F. Gamly, Esif, an interesting ant hemtiful work, whieh first bronght his name into motice (2) mis. Sro, 1517 - 1 bl : second series, a vols, swo 1832) ; Norretire of a Journey in the Norta (1se3, Sver): The Topagraphy of Rome athe its 1"irinity (1834, Svo) ; Rome and iss Emverom (Map, 1831). In Aumast 1814, on the departure to the continent of Carmime, J'rincess of Wales, consurt of Ceorge lV., she appointed him as one of her chamberiains. In that eapacity he attended her in varions parts of ltaly, but being attacke with the gout, was soon ohliged to resign his situation. In 1so0. he was examinel as a witness at the har of the House of Lords during the jroceed ings against her majesty after she hecame quen, and had returned to England. Snbsequently, he resided in ltaly, frincipally at Naples, having a house also at Rome, where he oceasionally took up his abode. He thel at Naples, Felruary 4, 1s:3ti. and was interred in the English burial-groman of that city.
( $\mathrm{BE}^{\prime}$ Llert, Christian Fürchtegott, a Gemman poct and moralist, was burn July 4, 1:1.i, at Haylischen, in the Erzelaige in suxony, entered the miversity uf Leinsie in $173 t$, where he devoted limself mainly to the struly of theology. After sume years spent as a tutor, amk as a teacher in a public acadeny, he obtained a professorship in the same university in 1751 . His lectures on poetry. rbetoric, and morals wre mumerously attended, and were greatly admired. He dicd 13th Decmber

1ain. (i, was aman of spotless virtue, but rather - theminate in mind and eharacter. He wrote fables, storice, diduetic prems, spiritual orles and songs. His most popular writimes were his fables and storins. They are marked by case and maturalness of manate. His spiritual ofes owe their continned P"pharity to their deeppiety, and to a certain vigur and loftiness of thight not to be found in his other pooms. $G$. is fu be considered one of the pioncers of modern (ierman literature. Ne marks, along with others, the transition from the dulness and pedantry of the previons generation of authors. to that rich and superabundant life which Goethe and schiller poured into the national hterature. (G.'s colleetive works (simmultiche Iferke) first appeared at Leipsic in 10 rols. (1769-1774), and have passed through varions editions; the most recent is that pullished in the same city ( 6 vols., 1840-1541). Compare (itherts L.ethon, ly J. 1. ('ramer (Leip. 1754, and by Dünis ( $\because$ vols., Leip. 1833).
(iELLLUS, AULEs, a Latin author, who sems to have lived abont 117-150 A.r. The cxact date, either of his birth or death, is not known. He is supposed to have been born at liome, where, at all events, he studied rhetoric. Subsequently, he proceeded to Athens to undergo a discipline in philosulhy. On his return to Rome, he entered upon a legal career, without, however, abandoning his literary pursuits. G.'s well-known work, the Sttic Nights (Foctes Attice), begun during the long nights of winter in a country-house near $\Delta$ thens, and completed during the latter years of his life, is a collection of miscellameons matter on language, antiquities, listory, and literature, in s 01 hooks, of which the Sth is wanting. It contains many extracts from (ireek and Latin authors no longer extant. The work is destitute of any plan or arrangement, is distigured by archaisms, and derives its value mainly from being a repertory of curions knowledge. The Editio Princeps appeared at liome in 1469 ; the most critical edition is that of Jak. Gronovius (Lus. Bat. 1706) : a more recent hut much less valuable one is that of lion ( 2 vols., Göttingen, 1SO4-1895). G. has been trinslated into English by Beloe (Lonl. 1795) ; iuto French by the Ablé de Vertenil (Paris, 1776) ; and (in part) into German ly Von Walterstern (Lemgo, 1785 ).

GLLON, 'tyrant' of Gela and Syracuse, wats the son of Deinomenes, amd was a native of the former city. Mis family was one of the ollest and most distinguished in the place. G. himself first figures in history as one of the body-guards in the service
 the latter, he contrived to nitain the surme power ( 491 b.c.), and about 485 p.c., he made himself master if syraense also, which then became the seat of his government, and to which he tramsferred the majority of the inhabitants of Gela. 1lis inflnrace soon extended itself orer the half of Sicily. ( 1 . refused to ail the Greeks arainst Nerxes, as they declined to comply with his demand that he should 1. appointed commander-in-chief. Alout the same time, Terillus, mer of Himera, in Sicily, invoked the aill of the Carthaginians against Theron of A.rigentum, who had dispossessed him of his state. (i., whe was in allianee with Theron, hastened to the ansistance of the latter, and on the same day (acernding to tradition) on which the (rreeks won the lattle of Salamis, he grained a complete victory wor the invalers at Himera. The eonsequence was an immoliate traty of peace letween him and the (arthasinians, who were compelled to pay all the "xpenses of the war. Itis clemency and the wisdom of his measures rendered him so generally beloved,
that when he appeared unarmed in an assombly sf the people, and declared himself ready to resign his power, he was manimously hailed as the deliverer and sovereign of Syracuse. The story current in later times, that one of the conditions on which he granted peace to the Carthaginians was, that their haman sacritices shoula be abolished, has probably no historical foundation, but it illustrates the general belief in the humanity of his character. O. died 478 в. с. The people, who, eontrary to his desire, had erected a splendid monument to his memory, paid him honours as a hero, and at a later period, when all the brazen statnes were sold under limoleon, his statue was made an exception to the meneral rule. Ihe was succeeded by his brother Hiero.

GEDA, a term often used to signify a preeious stone of small size, such as may be used for setting in a ring, or for any similar purpose of ornament; but sometimes by mincralogists in a sense whieh they have themselves arbitrarily affixed to it, for the purpose of scientifie classitication, as the desionation of an order or fumily of minerals, generally hard enough to seratch quartz, insoluhle in aeids, infusible before the haw-jipe, withont metallic lustre, but mostly brilliant and beantiful. A mong them are included some of the minerals, whioh, in popular laguage, are most generally known as gems -ruly, sapphire, spinel, topaz, beryl, emeratd, tourmaline, hyaeinth, zireon, \&e.-and some other rarer minerals of similar character; but along with these are ranked minerals, often coarser rarieties of the same sprecies, which are not gem.s in the ordinary sense of the worl, as emery and common eorundum, whilst diamond and some other preeious stunes, much used as gems, are exeluded. See Gicms.

CEMA'RA (Gliemara, a Chaldee word, signifying conplement) is that portion of the two Talmuds which contains the annotations, discussions, and amplifications of the Mishnah ly the academies of Falestine on the one hand, and those of Babylon on the other. The Babylonian Gemara, more complete as well as more lueid than the Palestinensian, possesses a much more highly valued authority. The final redaction of this latter falls in the middle of the 4th c. A.D., white the former was not completed till 500 A.d. See Mishevin and Talimed.
GE'MINI (the Twins), the third constellation in the zoliac, named from its two brightest stars, Castor, of the first magnitude, and Pollux, of the second.

GEMI'STUS, Giorgios, called Giorgios Pıfethos, and more commonly Gemistus l'lethon, was the last of the Byzantine writers. The exact dates of his birth and death are uncertain, but he is known to have lived between 1350 and 1450 . He was probably born at Constantinople, but the greater part of his life was passed in the Pelojonnesus. He was one of the deputies sent by the Greck church to the comeil which was held at Florence in 1438 , for the purpose of arranging a union between the Latin and Greck churehes. The council, however, entirely failul in its purjose. $G$. was more celebrated as a philosopher than as a theologian. In his time, the Aristotelian philosophy reigned supreme, but it had degencrated into a mere seience of words, from the study of which (. turned away disgusted, and applied himself to I'lato. l'ato's philosophy so charmed him, that thenceforward he devoted himself to its propagation; and in furtherance of this view, G., when in Italy, imuluced Cosmo de Medici to embrace it. Cosmo's example was followed by others in Florenee, and

## GEMMATION-GEMS.

thus a l'latonic school was founded in the west which tlomrished for nearly 100 years afterwards. During the latter part of his life, G. was engaged in litter condlict with the most eminent of the Aristotelians, among whom George of Trebizond hell a high position, and between him and (i, the discussion was carried on with most nuscemly violence. (: is last hearil of in history in 144, when we find him in the Peloponnesus in an otlicial capacity. (i. Wrote a great number of works in history, philosophy, theology, \&c.

GEMLJATION, or GENLMIPAIOUS GENERA'l'lON. See Refroduction.

GEMO'TE. Besides the great council of the nation-the Witena-gemot, or, as we more usually spell it, Witenagemôte (q. v.)-which correspondel to the Reichstage of the liranks, and which, though it took the place of the still more ancient mectings of the whole nation, to which Tacitus refers as characteristic institutions of the Teutonic tribes in his day, was a representative, though not perhaps an Elective body (Kemble's Saxoms in L'ngland, ii. p. 194), there were amongst the Anglosiaxnms variouts minor mutes or monts, which did not partake of the representative character. 'The existence of these is an instance of the manner in which the spirit of localisation has always maintaincl its ground, and lalaneel that of centralisation amonerst the Gremanic nations, and more particularly in lingland. There was the shire-gpmot, ar county conrt, which met twice a year; and the burg-gemot, which met thrice; the hundred-gemot (sce HoNDernd), which met every month, and an extraordinary meeting of which was held twice a year; the halle. gemote, or court-buron. These institutions excluded not only central despotism, but local tyranny in the shape of individual eaprice. The ealdorman decided only with the assent of the shire-ginote, just as the king was depeadent npou that of the Witan. Lappenberg by Thorze, ii. 1 , 320.

GEMS, ANCIFAT. The term gem, which is aplilied to jewels and other valuable and precions stomes, means in archaology engraved stones of the precious linds, and even small engaved portions of hard and brimitive rocks which have been set or worn as $j$ whels by the ancients. Before entering, however, nuon the subject of enqraved stones, it will be necessary to mention the princinal kinds which are mentioned by ancient authors, or have been foum ly modern researches to have been used for engraving.

Althongh the principal varicties of precious stones were known to the ancients, yet owing to the absence of scientific and chemical analysis, they aplear to have distinguished precious, and other stones, only by colour, specific gravity, and density. The different nomenclature, too, used by dilferent anthors, multiphed synonyms, and caused confusion: so that it las become impossible to identify
all the stones mentioned by Theophrastus, I'liny, and others. As a gencral rule, the ancients did not engrave such precions stones as the diamond, ruby, and sapphire, being eantent with those of loss lardness and value. The principal stones used lyy engravers were: (l) The canclian, and its more transparent variety the sard, sarilon, in eommon use in the lays of Plato (so called from Siardes in Lydia, but chiefly obtained from India and Babylonia): ( 2 ) The chalcedony, supposed to be the ancient calchedonion, used for scals and reliefs, of which two kinds have been foumd: (i) The ony.c or mail-stone, varinusly described by Iliny and his predecessors, but distinguished by a white layer resembling the nail: (4) The nicolo or Eypptilla, obtainerl from the onyx, a blue spot with a
black zome cncircling it: (i) The sardonyx, which was a varity of the onyx, having back, blue, white, and ral colimers, and particularly used for cameos and vases, hy entting down the lighter coloured livers to the darkest for a background to tho ficures, a stome much prized by the ancients; the signct of scipio Africinus the Elder being of this material, anit the Emperor Clandins esteming it amp the cmerald above all othor gems: (6) "the areate or arkates, su namel from a sicilian river, embraced many varieties, as the jaspachates, den-- Iryachates, but confounded with the jasper, consillered a charm against seoritions and spiders, used for whetstones, and a talisman by athletes; it was olbtained from Egypt, fireece, and Asia: (7) llasma in the Prasius, root of emerald, much used under the lower empire; its varieties were the Molochates and Nilion: (8) Numerous varicties of the jasper, iospis, green, bloorl-red, yellow, black, mottleal or purculam, and even blue, were employed for signets at the Euman period, and procured from Tmlia, Persia, and Cappadocia. Pliny mentions a remarkable statuctte of Nero, weighing 15 wunces in this material: (9) Garnets, the gromotici or red hyacintles of antiquity, which were principally in use at the latter days of the Foman empire ami amongst the Oricntal aations-with which may be elassed: (10) The corbmonlus, supposed, bowever, by sume to be the name given lyy the ancients to the ruby, was lmontht from India, Garamantia, Carchalow, ank Anthemusia: (11) The houcinthers or jacintl, a yellow variety of the garnet, which was used for signets, and eame from Ethinpia and Arabia: (12) The Lyncurium, or Lydinis, which is the anciont name of the true modern jacinth: (13) Several varieties of the emerald or smaraglus are citch liy the ancients, as the Bactrian or Seythian, supposed to be a green ruby, procipally derivel from the cmerald mines at Zahora, in the neighbonrhood of Copitos, worked by conscripts, aud described lyy Agrathareides. Many remarkable stories are told of this gem, which has only been fouml with engravings of a later period; one seat by a king of Babylon to a king of Easpt was 4 cubits long and 3 in widtli; in olielisk in the temple of . Inpiter, 40 enluits hich, is said to have been made out of four eneralds: and Theophrastus mentions an emerald colunn of creat size in the temple of Hercules at Tyre. In the Eryptian labyrinths, according to Apion, was a colossal Chapis of great height, made of emerald, This stone was used by gem-engravers to 'refresh" the sight, or inlaid in the eyes of statmes, as in the Linn at Cylrus, crected to Hermias; it was set in the ring of Polycrates; and used as a lens if Nero to lechold the fights of the gladiatons in the circus: (14) The Beryl or Barpllus, olstained from lndia, ent in shape of a hexagonal iyramid, was used at an carly period for engraving: (15) The amethyst, bronght from Arabia Petrea and Armenia Dlinor, is foumd used for intagli at all perions: (l6) 'The sapphims of the anements, supposed hy some to be lapis lazuli, came from Media, and anpears in use amongst the Eryptians and Persians: (17) The anthrar, sullosed to lie the ruhy, was not engraved; the hyacinthus has also been conjectured to be the Whe sapphire: (1S) The topaz, oppraon, applied loy the ancients to a green stone fonnd by the Tronlodytes in the island of Cytis, in the Arabian Gulf, and first sunt by Philemon to Bereuice, ont of which also a statue of Arsinoe was maile aml placed in the so-called 'golden temple' by Jtolmy lhiladelphus: (19) The Chrysolithus: (20) Chrysoprase, turipuise callais: (21) The magnes or loalstone, were used for cylimers and geus of a late period: ( 2 ) The green tourmaline, or avanturine, sandaresus: (23) The obsidian, obsidianus,

 real ancient names ly thein orthography and palseo. oraphy. 'The number of false antigue stones produced by eminent enuravers since the revival of the arts. has remered the diagnosis uf gene so difienent. that no branch uf archivelogy requires greater juderment. All gems of hingl artistie merit and great thish are suspected, esperally those with ganups of many firures, regular edres, and polished faces, or too great a polish in the deep parts. Conser imitathons have heen produced by lowling pastes or cobured glass (see Gems, Imirituon) with stones, and monting them in rings, so as to pass for a gem. 'Ihe apparanee of wear aml friction has leen produced hy introxlucins them for awhile into the gizzarls of turkeys, or in piered boxes plunged in the beds of rivers. The judgment monn gens enn lie, howerer, only matured ly a careful stm? and familiarity with all bramelies of ancient art. The conser imitations of pastes, the tonome, the file, and the gravir will fetect; but old goms reengraved, or new eompositions invented, require the nost eareful survey. The phan or circumstance of discovery is noly a fooble garante arainst deception, the conmere in false antipues lemg suceessfully plied um the mand even in the far E'ast.
'Thes dide implement nsed lis the aneient engravers appears to have been manle by splittimes diamonds into splints (adamantis rovsery) liy a heavy hammer, and then tixing these points liki glaziers diamonds into irom instruments, with which the worl: was axecuted by the band (form rotast). The dull, terthra, was also extensively used for hollowing ont the doepre and larger parts of the work, and emery powier, the smeris or Jaxian stont, for fulishing. The so-ealled wheel, a minnte disk of capper, secured to the end of a spindle and moistened with emery powder or diamond dust, amd driven liy a latlie, does not appear to have eome into use till the Braantine epoch. It has been conjectured that the artist used lenses of some kind, in eluhes tilled with water, to execute his mimute work; lut the ancient, like the momern enigraver, mother felt than saw his way. All these processes wure not emplayed by the same artist, for besides
 there was a polisher (molitor), not to mention armangers (commesitores of mourum), and memehants (\% mmaria, montomes gemmorum) who drove a fhorishing trade inemeralds and pearls and engraved stom"s in the days of 1 loraee.

The groneral fall of the arts at the perion of the lyzantine Empire, sems to have leen aceompanied ly the decline of the at of engraving on gems; and the Morovinutan and Corlovingian monarehs Ware ohligel to use antigue tems, instead of those "Hgaved by tha artints of their lay. Ianckerystals, however, were eneraved in a Iyzantine style of art, with saced subjeets, in the oth e.; but
than art wis all but lost till the rise of Lorenzo due Madia. when Gusami delle Corniole at Florence, ambltomenioo dei C'amei at Milan, worked moler his batronage it subsequent school of kem. engrivers oriminated with lietro Maria de Pescia, Whas worked for Len $X$. : the chicf representatives of the school are Miehelinn, Matteo de Bencdetti, the celebrated paintors Francia, M. A. Murett, Caralesse of Milan, Severo of liavenna, Icenardo da Vinci, J. Pathacarme, Dernarili of Castel Bolognese, whonded lis.s, celebrated for a Tityus eopred from M. Angelo. 'I'Hese were succeeded by Matteo lel Sassaro of Verona, who worked for Francis I., and probluced a crucitixion an heliotrope, so that the red spots secmed drops of blood issumber from the wounds of ('hrist; C'aratio, who flourished in Foland in IJ69; Valnrio dei Relli, who chiedy employed rockecrstal: Marmita, Domenico di Polo, Nanni, Anichini of Ferrara, and Alessandro ('esmi, celebrated $f(u)$ a cameo liead of l'hoeion; Wei linssi, a Milanese, engratuel the largest eameo of modarn times: dacomo da Trezzo, eelchrated for his purtrait, is said to have been the first to engrave an the diamond in 150t-an honour disputed, however, by Birago, amother Milanese, hoth artists having been in the sersice of Philip IT. of Spain, whomate a portrait of Ion Carlos and the arms of span on this gem.

The art, which lath deelined at the elose of the l6th e. in Italy, flourished in the $17 t_{1} c$. in (itrmany under lindotula II., for whom Lelimam cnaraced at Viemna: and in France, where Coldore Worked for Henri IV. amd Louis XIll. In the 17th e.. Sirletti, who died at liome in 1737, exeelled in portraits, and eopied antique statues with great excellence. The two lustanzi are celebrated in 1790, we for the head of Nero on a diamond. liera of Naples is said to bave eome nearest to the antique. Natter of Nuremberge who died in 1763 , is culcbrated for his intagli; Cuay and Barior were colehrated in the French schond; and the English protuced Reisen. who dicd IT:. ; Clans, who died 1739: smart, celebrated for the rapidity of his worls: and his pupil Seaton, a Seotchman, who cheraved purtrats of the great men of bis day. The greatest artist of the a:e, howerer, was Natter. Of the subsequent Italian school, Ghinghi, Girometti, Cerbara, Bernini, and I'utenati are manel praised. 'The loth c. produced many good English engravers, as Marchant, Burch, Wray, and Tassie; while Pistrueci, elebrated for his charming cameo, Weigall, and Saulini. who voade intagli, complete the list of modern gem-engravers.

With respeet to ancient gems in the dark and uiddle ages, they were prescred in shrines, chisses, amd othor ecclesiastical vessels in which they were sut, the passion for collecting them as works of art laving commenced with Larenzo de Mediei, who formed the Florentine collection, and had his name incisel on his gems. 'The large camei of the European collections, howerer, appar to lave been lrourht ly the Crusiders from the East. The Fremeli collection dates from Charles LX.. and was augnented by the successive kings of France; it is very rich in gems of all kinds: that of Berlin contaning the united eabinets of the Elector of Brandenbire and the Markraf of Anspaeh, collected by stoseh, consists of nearly 5000 stones. The Vienna eollection, far less numerous, is remarkalile for its large camei. In England, the collection of the british Dusemm, collected originally by 'Townley, Ilamilton, l'ayne. Knight, and Cracherode, consists of ahout EOM stomes, some of great beauty and murit, but is very boor in camei. The private collection of the Duke of Deronshire, formed in the last half ecentury, eomprises upwards of 500 intagli

## GEMS.

and camei, including some of the finest known. The Marlhorough, still more mumerous, comprises many time camei ant intagli, and numeroms works of the renaissance. The Pulzky collection, now in ltaly, contains many rare and choice intagli. A celelirated collection, the Poniatowsky, formed npon the lase of the oll collection of Stamishaus, last king of Poland, was so filled with forgeries ly its last possessor, executed by Roman artists with inseriptions le Diez, that it entirely lost its value on dispersiom. The Ilertz collection, the last great one solit, was remarkably rich in tine Etruscan searthei and ether intagli. There are probably about 10,000 gems reputed to be antique. Yet these are only a mere instalment of thase formerly existing. 'The immense value placed by the ancients on their schas, may be seen ly the seahbard ni Mithridates, valuel at 400 talents, or 47572 ; the pearl given lyy Iulius (iesar to Servilia. worth t480): that swalloweal by Clematra, valued at む500\%; and the pearls and emeralds worn hy Lollia I'aulina, wife of C'alimda, valued at $\pm 320.000$-all the stmils of provinces and the heirlooms of her family. These, malead, were probaldy not engraved, but in modern times great sums have leen pail to colcbrated engravers, as much as $£ 80$ of for whe cameo.

Although the acquisition of grms is tou costly for fovate indiviluals, impressions in glass, callewl pastes (see (iffass), in sulphur, gutta perela, or plaster of Paris, can be casily obtained, and they answer almost all the purposes of sthily. Some ancient impressions in terra cotta, indect, exist, and the poortr classes of Grece and lonne were content with glass pastes. The value of anticue crems, owing to the great difticulty of discerning those really so, has considerably declinel in this comentry, and even their anthority is sury cautionsly cited by archæologists. The principal writers of antimuity who treaterl of gems are, Onomacritus or the 1'sembo-Orphens. Dionssins Periegetes, Theophastus, and l'liny, whose chapter is compilet from antecedent Greek and Koman authors. Isidorus, $6: 0$ $\therefore$.o. gives an account of the principal stones; so An l'sellus and Marbolus in the 1lth c.; Mariette, Perres Giraves (4to. Paris, 1750); Paspe, Cataloque Lis L'mpruntes ales Pierres Gruetes ( 4 to, Lond. 1757), Millin, Intraduction a l'Etude des Pierres Grate (1※no, I'aris, 1796) : Kranse, Pempotes (sro, Halle,

(iEMs. Artificlal. Ever since the chemical comprition of ur most valued gems-the diamond, maly, "pal, \&e.--bas been known, attempts have bon made, with mare ar less success, to reconstruct them in the laboratory he inthence of intense latat, (lectrical aetion, de.

Amongst the most successful workers in this field, we may mention I:helmen,* Despretz, same-Claire Déville, and becquerel.

There are at present no reasons for believing that dianumsls of any appreciable size will be firmed ratiticially: Despretz Las, however, succeredel, by intense roltaic action, in olstaining minnte, darkcoloured erystals of carlum.
laron, which was liscovered simnltaneonely in 1sus by Dary in Englani, ame by Gay Lassac and Thenaril in France. was tirst exhibited in a crystalliseol form by Wöhler amel sainte-Claire Déville. '1hoy have not, however, suceceded in obtaining prefectly pure crestals. The ditierent tints which they exbibit are due to the presence of small quan-

[^5]tities of carbon in a crystalline state (the same condition in which it oecurs in the diamond) and of aluminium. It is mot impossible that in the discovery of crystallised boron, we may have advanced a step towarils the artificial 1 moluction of the diamoml. The boron crystals possess a brilliancy, hardmess, and refractive power saarcely inferior to those of the liamond.

Sainte-Claire Devill and Caron have published a very important Memoir in the Comples liendus ( 18.5 , wh. xtyi), in which they describe various processes by which they bave succeated in olotaining small crystals of white and green cormondum, rubjes, saphires, \& by the actim of the vapours uf dhurride uf aluminium and horacic acid on one another, they obtained crystallisel alumina (cormn(dum) in large, fut thin crystals, some of which were alout $t$ of an inch in length, and which in their larducss, and in all their optical and crystalloeraphic properties, resembleat natal corindum. When a little thurite of chromiun was added, a similar process pielded violet-red rubies of a perfectly matural tint; with rather more fluorile of chromium, hue sapphires were fieldent: and with still more of this ingredient, green eorumbum was oltainel, presonting the natural tint of the varicty known as musarotite. is mixture of equal equivalents of the thorides of aluminium and glucinm, when similarly acten on by bracic acil, vielded erystals of chrysuheryl or cymphane which, although very minute, were frefect in their form, and in all respects resembled the matural crystals. The action of fluoride of silicium on zireonia yiels small erystals of zircon or hyacinth $\left.\left(\mathrm{Zr}_{2} \mathrm{O}_{3}, \mathrm{NiO}\right)_{3}\right)$ : and by the action of silicic acid on a inixture of the fluorides of aluminium and glucinum, hexagonal flates of extreme hardness were obtained, which in some respects resembled emerald (which they wero attemping to forms). lut were not identical in composition with that gem.

The latest researches on this subject are those of Becquerel in the C'omptes Rendus (1861, vol. liii. 1. 11(6). After hasing for many years tried to ollain ems from solutions of silicates, and by fechle electric currents, he now uses intense currents, with high tensim, and in this way has succeeder in ulitaining opals, \&e.

GLMS, lmitarlos, or Pastes, Piemes Précielues Artificieltes, French imitations of the precious stones, are made of elass specially prepared. It diffors from orlinary glass in its greater density; at the same time it is made with the greatest possible amumet of transparency and pmrity. Its composition, generally, may be said to be silica of very imre quality; probably quartz crystals, potash, and oxide of leal; but the exact propartions are varied alnost ly erery maker, and each has a secret ingredient or twon to add.
The colours employed are msually the same as those used for colouring ordinary ormmentai glass, hat upon their carcful admixture, and upon the skilful cutting to represent the crystalline form of the real gem, the snecess of the manufacture chiefly depends. ly some persons, the cutting is carriet to such a marvellous perfection, that their work would deccive the cye of most ordinary judges, when well set and finited, or backed with silver or timinil. See Foil.
The glass used for artificial gems is very generally called atruse, from the mane of a cetrman who clamed the invention. But if we seek the real inventor of factitious gems, we must go far beyond the time of strass, for we find Pliny describing, under the nane of yemme ritree, certain inutations of precious stones which were linown in his time, some of wheh were certainly made of colourad

GBNFIAL DEAU RRER, in English peading.
was a 1 emprrer ( $q$. v.) withont shewing special cause. Where the objection to the I leading was fur want of form, a special demurrer was necessary : lut where the defect was in substance, a general demurrer was sutlicient. By the Common Law Procelure Act ( 1552 ), special demurrers have been aloolished, and the distinetion hats ceased to exist.

GENERAL 1SSUE, in Faglish plealing, is the form in whieh the defenclant traverses or meets with a simple denial the whole allemations, or the principal fact on which the plaintiff relies in his declaration. Thus, in actions foundel on wrongs, the Feneral issue is ' Not Cuilty;' in actions of delit, that the defendant never was indebted; im actions on a deed or bonal, non est juctum, i. e., that it is nut the dead of the defendant. Under this issue, the lefendant may prove that he never executed the deed: lout not that it is bad in point of law. In criminal prucurdings, the general issue is 'Not Guilty,' ly which plea, without further form, every lerson, nut having the privilege of Iecrage, unon heing arraigued upon any indictment for ireason, felony, or piracy, is deemed to have put himself upen the cunntry for trial. Where in , risoner refuses to Ilead, a plea of Sot Guilty may be entered for him, 7 and 5 Geo. IV. e. 2s. Under the plea of Not Guilty, the prisoner is entitled to give in evidence not only cverything which negatives the charge, but also all matter of excuse or justification.
gine ERAl, LIEN, in English Law, is the right which a party has to retain a chattel as security for the payment, not only of the particular article, but of any balance that may be lue on general account in the same line of business. General liens do not exist at common law, but depend upun arrecment, cither express or implied, or upon the usage of trade. Thus, attorneys have ab lien for the balance of their accomnts over the papers uf their clipnts. bankers, factors, warchusemen, and others, have
also a lien for the amonat due to them on the pumal babance of their accoments. But it bas leen When that fullers are not entitled to this mivilege. linse 2 . IIart. S Tannt. 490. The right of wharfingers also is not clear in all cases, I Iolderness 2 : Collinson, 7 lian and Cres. 212. In regard to carriers, there has been much dispute whether, by the usage of trake, they have a gencral lien over goods intrusted to them: but the prevailing opinion appears to be that they have. The master of a ship has no lien on the vessel or her freight for his dishursements on her account: but now he has the same lien for his wares as a seaman has; 17 and 18 Vict. c. 104 , s. 191. By 6 Geo. IV. e. 04, it is providet that any person in whuse name grouls are shippel shatl bo dermed to be the owner so far as to entitle the consignee to a lien for any advances made for the use of such persons, proviled the eonsignees had no nutice when the advance was made that they were not the true owners. As a lien rests upon the right to retain ]ussession, it is lost by abandonment of the possessinn of the gools.

In sootland a similar right exists, under the title of Tetention ( (1. v.). See also Liss, and Hypotirec.

GENEIAAL OFFICELS is an officer of the general statt of an army to whom is intrusted the command of a body of men, not less in strength than a Brigade (1.v.). In an army of very large propertions, the nomal sequence of command would be the fullowing: the general commanding-in-chief, qeneralissimo, or fielemarshal, would command the whole furce; the generals would have separate corpsellumée; the lieutenant-generals, wings of thuse conps-d'armée; the major-gencrals, divisions in the wings; and brigadier-generals, brigades in the divisions. In practice, buwerer, an army is rarely large enong to allow of this exact scbeme of it military hierarchy being strictly earrich out.

In the litish serrice, colonels hecome majorgenerals (excent in cases of selection for very dis. tinguished service) in order of seniority, provideal each has served on full bay for a cortain mumber of years: promotion to be licutenant-generals and generals follows in exact orker of senority. From the last, ${ }^{\text {romotion }}$ t" the excertional rank of fieldmarshal is confureel in rare instances by the special favour of the sovereign, who represents in person the sole command and possesses the patronage of all the land forces. In addition to the colonels who beeome effective generals, othicers who have retired on half-pay at earlier periods of their eareers rise by seniority to the rank of general officers; but they erntinue, notwithstanding, to receive only the half. pay of the rank in which they retired. With regard to vemuneration, general oflicers bold 164 henorary coloncleies of regiments, worth, with few execptions, $\pm 1000$ each per annum, and the remainder receive mattached pray of $£ 600$ a year, if they have been in the guards ; $£ 1,6 s .3 \%$. a day, if in the artillery or engineers: and $£ 1$, 5 s. a day, if 1 reviously in the line. This pay is receivel during non-activity, but when emplloyed actively a general receives, in aldition, £5, 13:. 94. a day; a lieutenant-general, む3, 15s. 10d.; and a major-general, £1, 17s. 11d.; besides rarious allowances. The only generals' commands in the British service are, during peace, the commands-m-chief of the amy generally and of the force in India. According to the estimates for $1862-1863$, there are $S$ lientenant-generals, 29 major-generals, and 10 hrigadier-generals employed actively, exclusive of the numbers serving with the army in India. The last-named rank is ouly a temporary one in the English service. conferred very commonly on the sonior regimental officer of the corps composing the lirigade: during ataty as lurigadier he receive's $E 1, S, 6,6$. a day in addition to

## GENERAL SHIP-GENERALISATION.

regimental or other pay, Captain-general is a rank very rarely conferred by the sovereign, who holls it eatoficio. Ihere has heen no captain-general, other than the sovereign, during the present coutury:

GENELAALSHIP, is a ship which has been advertised by the owners to take groots from a particular port at a particular time, and whieh is not under any suecial contract to jarticular moschants. The owners, in this ease, marge separstely with each merchant who apllies to them to combey his goods to the slipis destimation. The eondract between the owners, or the master actine in their behalf, and the propriotors of the wants, may in the case of cencral slip le estallished hy parole evidence, anif, imberd, there is maly any other writing on the smbject beyoud the ablertisement and the bill of lading. In reneral ship the master being intrusten liy the owners with fnll fower to contract for and takn in gools, no agreement for freight which any one may have made with thes owners, independently of him, will be effectual to scoure room in the vessel. All such arreenuents must be intimated to the masler, or those actinis for him on board, before lie has engaged freicht for the whole vessel. By such intination, a preference will be secured over the momehat who brimos his gronds to the ship's sille wh chance If the owners of a general ship have alvertised her as lomal, for at particular port, they must grve specifie notice to every person who maty ship goods un haral, of any alteration in her destination, and they will he liable for the consequences of nerglectins to do so. Detll's Com. i. 433 , shaw's edition; Abbot on shippiny, 1. 283.

## GENERAL VERDICT. See Vernict, Jitis.

GENERALISATION. Our experinnce of the work leads us to reenguise not only great varicty, but also numerous instances of agreement in the mielst of the varicty. We do not call the continuance of the sume fact an agreement; it is only when, amid difference of aceompanment, we recognise a common feature, that our attention is awakented, and our mind interested. Sometimes the emmmon foature in a number of varying objects is obvous and miversally noticel; as when we dentify the rount form amidst all disparities of size, colonr, and substance. At other times, the resemblanee is so whseured by the amount of differenee, that it has lain for ages unperceived; the fill of a stone wias never suspected, hofore the time of Newtom, to have anytany in common with the motions of the monn and planets. When we see the same property or aneet repeated under great varlety of circancts, mane on otherwise that this agrement exists, we are sairl to wark ont a froneral or generalised property, or fact; while the imbivilual instances are termed the pereticulars, on which the uther is erounded.

Po understani the full meaning of gemeralisation, and the questions therewith connceter, we must anlvert to the distinction between two mokes of the opration. In the ome, we generalise an individual or isolatel property-as roundness, whiteness, weight, attraction, justice-and assign what we think the axact nature of the common feature thus singled out. A number of desigmations have been riven to this process, aecording to the partimbar stage in the operation most specially taken into view ; these are ('lassilication, General Kotion, General Term, Defination, Abstraction, Concept or Conception, Idea. 'Jluy all suppose that we have a jlurality of objeets with agreeing properties, and that agreement has lnon taken notice of, and rmbodied in such a form, that the mind can deal with it to the neglect of the boints wherein the prarticular things difler among
themsclves. They suppose, further, that we make no allimation levonl what is implied in the filentifying of so many ditiering ohjects-anmely, that they (lo) agree in the print in question. Noother matter for behef or dishelief is presented in the notion of roumlacss lut that certain thing have leen comparel, and have been fomm to arree in Inssessing $^{\text {nom }}$ that attribute. ' $\Gamma$ ost atempt to form a mencral notion, or to makk a property mot attaching to anything in nature, is a pure irrelevanse ame alosurdity; and althongl ly a thold streteh of margination we might pople the earth with ehinuerical ohjects, and lime arevorents amome them, yet swely generalities coull nut he introdueer into any process of reasoning ; it is prsmmed, that wherever a semeral property is specition, there are thinss in hature having this 1 noperty in company with the others that miske n! the total eharacteristies of ench.
lout the other kimd of feneralisation introbluces belief in a totally dillerent shape. When insteal uf identifying a property, we junntify a man or con junction of distinct propertics, it has to he seen not nerely whether the common features are correctly renderal in the ganeral notion, but whether the allegond couplims always takes place. 'Ihns, when We compare the sea coasts all over the slober, we fime, with sume exceptions, that twice in daty the sua alvances and recedes on the shore: this finct we express hy the gemeral name the tides. When, how ever, we go further, and wote everywhere the coincidence between the tides and the positions of the mon, and genaralise that eomedence, we attain to it more complicatend rasmlt. We are now ealleal upun to believe not merely in the accurate correspundence of a reneral motion witl the partionlar dijecta, hat in the constancy of the ennimetion between two distinct proweties, so that the occurrence of one shall aways comen as evilunce of the other. '1"he elitiorent aspects of this higher operation have given rise to another series of clesionations, contrasting with those given above for the simpler operation: these are Indaction, Inductive Generalisation, Conjoinel Properties, dímmation, I'roposition, daligment, Law, Orler of Nature. These all involve truth or falsehnot, inasmmeh as they all pretend to give us a positive assurance that wherever we find one thing we shall time some other thing present or absent, and lee ambles thereby to anticipate our indivilual experience of the course uf nature. A feneral motion e:an often lie expressed in a single wore ; the mone is the prat of speech that names. luth purticnlar oljeets anul general notions. A genoral [roposition is a complete thouchat, and repures a sentence for its enmmeiatom ; it avolves the a'co along with the nome. Ileat is anotion, and so is light: lat when we mite the two in the anlimation that heat is the cause of light, we imblicate: something that is true or false, that may he prover or elisproved, believed or denied.

This higher form of genuralisation is treated of umber innectios. On the other and simpler form, a fow further explanations are udded here. In the ispration of forming a general notion, the first step is something of the mature of Classilication. Wै mast assemble in our view a number of particular olojeets, being moved to loring them torether by the atractive bond or association of simadarity. The History, for assembled are a class. ln Natural all the guadrupeds that we have erine together in the mind knowledre of aeds that we have ever had any roumled on the peeuliarity of walking on a class, Another class is peende up of the mimals that-fours. the air ; a third, of those that live in the sea. By such sucerssive groupings of creatnres that havi a lindral nature in one or more respects, we gradually

The forming of a class leats to the adoption of a Class Name, in other worts, of a thenot mome. whin is a man apticahn to erery indinhual member of the chass, m consergune of incing maderstome to exprose mane than they all have in common. 'Thus we hate the name 'romin' to experss all round objects, mitting any reference to other peculiaritie's that may attach to them. So the names lind,' 'huth,' 'salt,' are appheable ablice t/ a vast mumper of intividual thinge. When the scheral name has been devised, we can by means If it spak of all the particulars in ome lroath. on condition that wo intert only torefer to the forats of community.

The frucess callon Ahstraction is further implich. When we bring tusether, ir constitute a chass, in virthe of a proviling resmblace, we are sait to 'abstract' from the indiviluals werything else "xepit the juints of ageement. In the langage of sir W. Hamiltm, we uttent tu the likeness and ohistrot the differenes. The notion that we have If the common quality is termend by the same fhilusepher the tome pit: lut it has hern usmal to
 for the same pmonse, although a perversion of the miginal appleation of that worl. The common attribat, of romed batios, the romml ligure, or form, is the concept, or the alnstrate iden of remme ness. The precise character of this mental dement or process has been much disputed in philusompe, there being three diflerent sects that have ormen up in cunncetion with it; the licahsts, Numbialists, athl Conecptualists. The licalists suve an actual indefendent existence to the prototypes of our fancral nutions, mantaming that a prart from all - ireular buties there existed in mature a circular form, having ne other attribute suever, like a circle of Euchis bereft of the actual line reguired to mark the figure the the The Nominalists consilered that the only gencral thing was the comman nane ; the Conepthalints allowem a mental existence tu the erneralisiol attributes, but no nure. (Sir W:
 are, no douht. near tha trath; fir atthough we canwot, with Plato, aflim the existanee in mature of "gonerals' that have ne cmboliment in particulars

 we mant still grant the mind the power of atteme. ing 10 thenght to what is comum, nergecting for the that the diaurements. We can thank of all the emseturnees of the cirebar theure, without sporially attombers the other peculiarities of any inhumbal cireld." This ahstractive proecs is per. thram in difheret was, acorling to the nature of the suljece. In sommetry, for examphe, we can draw dianams that are little other than makel forms. althoush we must make them of a letinite size: and in contempatine these, we are enabled to think of form withont sulnstance. We cannot use this methenl in Natural linting; we cannt form a conerption of a bire by dasem that gives nothing but what is common to all hirls. If we are reasoming upn the properties of the class, we may tirst call into view sume um as an example, say a pigeon; from consilderine which, we can go so far as to note the common feculiarities of foathers, winen, bill, de: :ank when we have "ompleted the description, we run ower in our mind a mamer of other linds, to sere that we have not mentioned points special to the pifeon. In fact, we must have within call the whole of the mombers of the class, if we would reason cencrally renatin: it. After we have thens chedenl and corrected our pencralised description, We can emboily the abstract beca in a form of very whte wearrence in our gencral reasonings, nandy, a verbal statement of the common attributes. Iy mems of this, we may often dispense with the reforme to the particulars, except to know the prefe meaning of the language, which meaniug is still smun surt of gemeal conception of the ohjects. Wia mast have a mencral notion of feathere, and of the structure of the bill in hiris, pon the phan aluse mentioned of holling in the mind smme typical instance sulijwet to correction ly a combarion of all the instances coming under the woms. A. that, in fuint of fact, net weneral reasmang hats ever hem mented to supersche totally this reforrace to the particnlars ; the fomal reasomings of mathematies require us still to have in the mind concrete quantity, or onc thing as equal to, greater thim, or less than, another.
These remarks lead us to the nature of Definition, Which is one of the important clesignations srowing ont of the operation of gencratising. To define, is to limit, settle, and specify the exact compass of the pronerties common to aclass. Vsually this is done by mans of language : lint in reality it is, and must be dome, by a refercnce, direct or remote, to the particulars themselves. This reference frequently has the appearance of being dispensed with. 'Ithe reasm is that many gencral motions are compounden of whres, and we can understand the composite notion from its components, without going further ; that is, without producime particulars. Thus, a circle in the alstract minht the made intelligible ly juinting to a number of concrete circles, such as are drawn in Euclicl: we should then have to inmpress on our minds a sutficicnt mumber of these to prevent us from ewer associating with the general idea any me size, or any one colone of the outline (which must be drawn in black, red, hue, or some other eolour). No one circle is really the general notion ; this must le nothing less than a multitude of actual circles, which the minel aprehends ly turns, so as to be sure of never atimming any attribute as common that is in fact peculiar to one or a few. But the concept. circle, ran be got at in another way. If we retermine first what is called a 'point' in space, athl a 'line' procecding from that print, and made therelve around it, the other extremity of the revolving line will mark a course which is a circle.

## GENERATION.

Here, if we jossess ourselves of the simple motions or concepts, Puint, Line, Snolution, we may attain to the notion, (ircle, without examining actual circles in the concrete. fowe maty tutine an usal, or ellipse, and many other tigures. This phatice of referring to a simpler order of concelta for the constituents of a given one, is the main function of the Wefinition, which aphlies, therefore, tu complex notions, and nut to such as are ultimate, or simpho in the extreme degrec. To detine in the last resort, we must reme to gunting the particulars. We cannot Wetine a lime by anything more elmentary. To say, with lenchu. that it is lenath without health, is me assistance, as we must still go to our expurience bor examples of lenuth : and length is not a more simple ikea than line, being. in fact, but another woul for the same thing. Nerortheless, it has licen often supmeal that there are seneral notions indepembat of all experionec, or reforence to particulars: the form commonly wiven to the fombatinns of the sciance of matlicmatios having faroured this riew.

The name 'semms' is also comected with tha IW sent subject. It is co-relative with amother word, "aceles," which, however, is itself to some extent an enderalisation; for cery species is consimmen to have individuals under it. "Thus, in Zoolugy, filis is at genne of animals, and the lion, tiper, cat de, are among its species; hat cach of these specius is the sermeralisation of an innumerable number of inlividnal lions, tians. \&e., differing consulerably from one another, so that to express the species we are still olliged to have recourse to the operations of comparison, abstraction, and definition. Tfoms and species, therefore. introduce to ns the existence of sucerssive generalisations, more and more extensive in their range of application, and pussessing, in consequence, a smaller amotint of similarity or community of feature (see Extexion).

## GENERATLON. See IEpfoluctios.

GENERATLON. A term in use in Mathematios. One geometrical tigure is said to be penerated by another, when produced or formed by an operation performed upon the other. Thus a cone is gemeratel by making a right-angled triangle revolve about one of its shles anljoining the right angle as an axis. In arithmetic, in the same way, anumber is said to low generated when prounced by an operation perfomed on one or morenther numbers. Thus, $3 t$ is generated ly the involution of it to the ol 1 pwer, or hy the multipication of 4 anid 9

GENERATION, Emenil. See Trixity, Dortrine of thi:
(ikNERATION. Nontavers. From the earliest perios to the termination of the midule ages, no she ralled in question the dectrine that, under ecrtain faverable combitions, of wheh putreiaction was on of the must important, animals mingt lie proluceal without parents. Inaximander and Emjestocles attribnted to this form of foneration all the living leings which tirst pepled the globe. Aristotle wathont committing himself to so general a view. maintains that anmals are sometimes formed in putrefying soil, sumetimes in phants, and smetimes in the flum of other animals, and lays down the followine seneral principle, that every dry substance which beones moist, and every morist bobly which is dried, probuces hivine ereatures. providei] it is tit for nomrishing them.' 'The views of Lacretius on this subject are shewn in the following lines:

Xone viles quacunque mora. fludoque liynore
Corpera tabucrint, in parva anmalia verti*
And Pliny maintains that "quedam gignuntar ex mon genitis, et sime ulla simili origine" Virgil's directions for the production of bees are known to
cvery ruder of the Ciporgice and an expression in the lionk of Jutges (xiv. 14) prohably points to a similar "中unin.

Pawsing from classical times to the later perion of the mindle ases, and the two snecembing eanturies, we may quote amonget the almonatn of this thery Cardan-who, in his treatise De seblititate (linit), asserts that water congenders tishes, and that many animats sprine from itrmentation- Ihtrovandus, Liertus, Gassendi, ́a alimer, Van Melmont, who wives special instructions for the artificial prodation of mice, and kircher, who in his Vumbes fubberentens (in the chapter •]e I'anspermia Verma') describes, and actually tigures, certain abimals which were produced nider his own eyes liy the transforming influence of water on frayments of the stems of different plants.
lecdi, the celcbrated ltalian maturalist, whose Eirperiments on the fienerution of Insects were fubs. lishod in I6f: seems to have leen the first on? that the eloctrine of spontanems generation concounteret. In this work, he proves that the worms and insects which apme:m in decaying substances are in reality develoned from esses, deposited in thase subistances by the parents. Leuwenhoek, Yallisneri, Swammerdam, and other cmincont naturalists, som contributer ablitional facts ant arguments in farour of licdis siew: and as from the time of Fioli tor the present day, the tide of opinion has arnerally turned stronsty aganst the iloctrine in yustion, it is unnecessary to carry the historical skutch further.

Thu entozo, howerer, continum to he a great strmblinghtock. - When, says Professor Owen, - the entuzulogist contomplatel the tenier fixed ten the intestine, with its uncinated and suctorious head huriel in the mucous membrane, routed to the stont, and imbibine murishment like a plant - when he saw the shagish distomen (or thake) adhering by its sucker to the serons membrane of a closed internal carity; he naturally asked himself how they cot there; and fimines no obrinus sulution to the hatlicalty of the transit on the part of sum animals, he was driven to the hypothesis of spontanoms grneration to sulve the difticulty. It is no womer that Itudulphi (Isus) and bremser (1set), who stulied the entosen rather as naturalists than physungists, shombl have bern led to apply to them the easy dxplation which Aristotle harl given fur the coming int, leeing of all kinds of Verines-viz, that they were spontancously gencrated. No uther axplanation, in the then state of the knowledre of the develoment of the entozoa, apleared to be adeluate to aceome for the fact of the ir pettimg into the interior cavities and tissutes of hinher animals.' The recent investigations of Con Sieboh, Kidhonmister, Van Beneden, Philippi, \&e., regarding the develoment and metamorpheses of the entozua, have, however. tended to remove nearly all the difliculties whidh this sulject presentel; and the alvocates of spontanenus generation are fairly driven frum this, one of the last of their batthertiolls.

The only pint at present in dispute is, whether microsen 1 ic urganisms (amimals or plants) may be spontanemsly gencrated. It is well known that if we examme under the microscope a drop of water in which almost any anmal or vegetalle substances have been infused, and which contains the particles of such substances in a state of decay or denmansition, it is foum to swarm with nimute Jivin arganisms. The question at issue is this: Are these crganisms developed in the water, if the necessary frecautions have been taken to exclude every anmalcule or germ capable of development both from the water and from the air that has
access to it? A wall-known cxperiment, devised ly Irofessur sehulze of lerthen (a description of which may Le fomal in Cwen's Lectures on the Invertebrate Animals, od al. 1. 44), shews that with du" precantions in reference to these foints, no animal or veratable organisms are proluced. This experiment Wis continued uninterrugtefly from the esth of thay until the begiming of Augnst, $\cdot:$ ond when, at last, the professor separated the diflerent parts of the apparatus, he could not tind in the whole liquid the shichtest trace of infusoria or conferva, or of monld; but all three presented themselves in great ahondance a few days after he hat left the thask standing open.' is vessel with a similar infusion, which lie placed near the apparatus, containd vibriones and monads on the second day of the experiment, to which were soon added larger polygastric infusoria.
ifers years ago, MI. Ponchet announced that he had repeated schulze's experiment with every precaution, hut that animaleules aud plants were invariably developed in the infusion on which he operated. To move that the atmospheric air contrined no germs, he substitnted artificial air-that is to say, a mixture of $\because 1$ I arts of oxycen gas with 79 of nitrogen. The air was introluced into a flask containing an infusion of hay, prepared with distilled water and hay that had been exposed for twenty minutes to a temperature of $210^{2}$. He thus aparently guarded against the preseace of any germs or animalcules in the infusion or in the air. The whole was then hermetically scaled, so that no other air conld gain access; yet after all these precautions, minute animal and vegetable organisms alpeared in the infusion. He releated the expriment with pure oxygen gas instead of air, and obtained similar results. These experiments are descriled by louehet in the immales des semences Nuturelles (IS5S, thi series, vol. ix. 10.372), and the same volume contains important articles ly Hilne Elwards, and by De Quatrefages, in ophosition to Ponchet's riews.

A very large majority of our physiologists of the present day ruject the doctrine; most of the alparently exceptional cases, as, for example, the mysterious presence of the entozoa, have been fomm tu admit of ready explanation; and if we do not positively deny the prossibility that animaleules may be generated spontaneously, we may at all events assert that such a mode of geveration is not probable, and bas certainly not been Iroved to exist. Those who wish to know more fully the arguments that may be adduced in favour of and in opposition to, the doctrine, are referred, on the one hand, to Pouchet's Métrogénie, ou Traite de la Générution S'pontanée, basé sur de Nourelles Experiences (1559) ; and, on the other, to Pasteur's Mémoire sur les Corpuscules Organisés qui existent doms litmosphere; Examen de let Doctrine des Gintrations spontanées, in the Amales de Chimie et th Thusique (oul ser. 1862, vol. lxiv. pll. 1-110). ("llue subject was discussed by l'rof. Huxley in his address to the British Association in $15 \%^{\circ}(1$.
generitions, Aldernation of, a phrase devised by Steenstrup, a Danish naturalist. about twenty years ago, to signify 'the remarkable and till now inexplicable natural penomenon of an animal jiroducint an offepring, which at no time $r$ acmbles its parent, but whith, on the other lame, itself luings fortb a progeny which returns in its form amd nature to the parent animal, so that the maternal animal toes not meet with its resemblance in its own browd, luat in its descendants in the aremul, third, or fuarth degree or generation; this always taking place in the different animals whict exhbit the phenomenon in a determinate generation,
or with the intervention of a determinate mumer of generations.'

The phenomenon has been olserved in many of the hydrezoa, in various entozon, in annelidss, in molhwcoids (salp(t), and in insects (aphides); and its nature will be leest understood ly our giving one or two illustrations.

We commence with the development of the meduse ur jelly fishes, which lodong to the chass hentrozoa. The medusa discharges living young, which, after having burst the covering of the ege, swim alont freely for some time in the body of the mother. When first discharged or born, they have no resemblance whatever to the jerfuct medusa, but are littlo cylindrical bodies (ilig. 1, a), covered

Fig. 1.
with cilia, moving with consideralle rapidity, amd resembling infusoria. After moving freely in the water for some days, each little animal fixes itself to some olyject hy one extremity ( $N$ ), while at the oposite extremity a depression is gradually formed, the fonr corners $(b, f)$ lecoming elongated, and gralually transformefl into tentacles (c). These tentaeles increase in mumber till the whole of the mper margin is covered with them ( $刀$ ). Transverse wrinkies are then seen on the body at regula intervals, aprearing first above, ami then extenting townwards. Is these wrinkles grow deeper, the tuge of eacb segment presents a toothed appuarince, so that the organism resembles an artichuke or $l_{\text {ine- }}$ cone, surmumeted by a tuit of tentacles ( $h$ ). Whe segments gradually beeome more selaratel, until they are united by only a very slender axis, when they resemble a pile of shallow cup placed within each other (i). At length the upper segment disengages itself, and then the others in succession. Each segment ( $k$ ) contimues to develop itself mutil it becomes a complete medusa ( $k$ ) ; while the hasis or stalk remains, and produces a new colony: Here, then, we have the ran of the medusa gradually developed into the polypoid arganism ( $h$ ), to which the term strotilit (from strobilos, a pine-cone) has been given. This polype, hy gemmation and fission, yielis meduse with repudhetive organs.

The phenomenon of alternation of generations in the Cestoid Worms ( $q . v$. ), and in certain Trematuid Worms (see Ficki), has already been noticed, and will be further discussed in the article Tapeworms. The fission of certain annelids (Syllis and Myrianida), (see Reproduction), presents an example, although at first sight a less obvious one, of alternation of generatious, the non-sexual parent worm yiehing by fissure progeny containing spermatozoa and ova, from which again a nou-sexual generation is produced.

The salpe (molluse or molluscoids belonging to the family Tonicuter) are usually regarded as atfurding a goor illustration of the phenomenon under consideration. It was in these animals that it was originally moticed ly Chamisso, who accompanied lootzebue in his voyage romel the world (1815-1818). The Salpe (from twenty to forty in

## GENESEE-GENESIS.

number) are united together by special organs of attachment, $s u$ as to form long chains, which tloat in the sea, the mouth (m), however, being free in

Fig. 2, A.
each. The individuals thens joined in chains (fig. - , A) romace eags ; one ege being generatly devcloped in the body of each animal. This ege, when hatched, proluces a little molluse (fig, $\because, I$ ), which remains solitary, differs in many respects from the parent, does not produce an tre hat yoproates ly a kini of internal gemmation, which gives rise to chains ahready seen within the louly of the parent, which fuaily bursts and liberates them. These chains, again, bring forth solitary individuals.

The only instance in which this phenomenom neeurs in animals so highy organised as insects is in the Aphidis, or Plant-lice. In many species of the genus aphis, which in the perfect state possess wings, a large proportion of the individuals never acquire these organs, but remain in the comlition of larvie. These withont any sexual minn (none of them, indeed, being males) bring forth during the sunmer living young ones resembling themselves; and these young ones repeat the process, till ten or eleven successive broods are thus 1 rodnced; the last progeny, towards the end of the summer, beiner winged males and females, which produce fruitful eggs that retain their vitality during the winter, and give birth to a new generation in the sprines. long after their parents have perished. Other pecnliarities of insect-generation will be noticed in the artiele Paithexogenisis.

Several high physiological authorities, amongst whom we may especially mention Huxley ('On the Anatony of Salper,' in Ihi!. Trems. for 1851, and 'On Animal Indiviluality,' in Amn of Not. IFint., 21 ser., vol. ix. p. 50.5), and Carpenter (Primiples of Comparatice Physiolom, 1854, object to the term 'alternation of generations.' 'The detached portions of the stock originating in a single generative act are termed Zöoidls by these writers, whilst hy the term animal or entire enimal (the equivalent of Zön) they understand in the lower tribes, as in the higber, the collectice moduct of a single gencrutive act. Here they include under the title of one gencration all that intervenes between one generative act and the next. 'If,' says Ir Carpenter, 'the phenomena lu. viewed under this aspect, it wall be obvious that the so-called "alternation of generations" has no real existence: since in every ease the whole serics of forms which is evolved hy contiuuous development from one generative act repeats itself precisely in the products of the next generative act. The alternation, which is very frequently presented in the forms of the lower animals, is between the products of the generative act and the products of gemmution, and the most important diflerence between them usually consists in this-that the former do not contain the generative apparatus which is evolved in the latter alone. T'he generatin, zöoid may be merely a segment cast off from the body at latge, as in the ease of the Tupe-rorms (q.v.), or it may contain a combination of generative and locomotive organs, as in the
self-dividing Annelide. It may possess, however, mot mercly locomotive organs, hut a complete nutritive aphratus of its own, which is the case in all those instances in which the zöod is east ofl in an early stage of its develoment, and bas to attain an increased size, and irequently also to conlve the generative organs, subsequently to its detachment : of this we have examples in the Mofluser ludded ofl from Hydroid Polypes, and in the aggregate solpue.' - Principles of Comparative Physioloyy, 1. 520.

GENESEE', a remarkalke river of North America, rises about 10 miles south of the loundary letween the states of I'emnsylvania and New York, flows north through the western portion of the latter stato, and ifter a course of 145 miles falls into Lake Ontarin, 7 miles north of the city of lowhester. The ( $A$, is not only natable for tho variel and romantic chatacter of its scencry, but is alsu famous for its extraonlinary falls. of these falls, which are five in mumber, three, ocemring within a distance of two miles, in the vicinity of the town of Portage, abont !ow miles from the month of the river, are respectively 60,90 , and 110 feet high. The other two, the one occurring immediately above Iochester, and the other ahout 3 miles helow that city, are both uf abont lu0 feet.

GE'NESIS, ur mome fully GENESIS KOSMOU (Oricin, Generation of the World), is the mame first givin by the Septhagint to the opening book of the lentatench. In the Ilenew camm it is called Bor, whith (1a the Jumiming), from the initial word; in the Talmul, it is sometines refored to as - The Book of 'reation,' or 'The Book of Abraham, lsaac, and Jacob.' Its Masoretic division into fifty chapters, followed in the English Lible, or into I2 large and $4: 3$ small encyclieal sections (Setarim, Parshoth), has been groundel rather on convenience than on any corresponding division of the suhject-matter. The book seems of itself to fall most naturally into two totally distinct parts: the tirst of which would extend from the beemning to the eall of Abraham (c. i.-xii), and cnibrace the account of the ercation, pariulise, fall, the generations between Adam and Noalh, together with their religion, arts, settlements, and wanalogy, the deluge, the repeopling of the earth, the tower of Babel, the dispersion of the lmman race, and the generations between Noah and Abroham: thus
 or the history of the patriarchs (Abraham, Lot, Ishmatl. Isaae, Jacol, Esan, and Joseph); the whole concluding with the settlement of Jocolis family in Egypt. Another division seems indicated by the inscription Tultolh (Origin, Genrration), which orcurs ten times in the course of the book, intro. ducines at each sepretition a new eycle of the narrative, and which would thus split the whole (from c. ii. 4) into ten distinct sections of dispro. portinnate length.
The period of time over which the Book of Genesis extends has been variously computel; the namber of years commonly assicned to it is about $230 \%$; the variations in calculation seldom exceeding units or tens of years; Bishop, Males alone, following the Septuagint, reckms 3 til! sears.

Being a portion, anel the introductory portion of the l'entateuch-at the same time that it forms a complete whole in itself-it canmot lut be considered as laying down the lasis for that theocracy of which the development is recordesl in the succeeding hooks. While the dosign amd plan of the Pentateueh is thas also that of Gensis, the latter, however discordant its constituent parts may seem, dues not lack the nocessary unity. Deginnin4: with the cosmogray, or rather geogony, i. e., the

The situation of the town on both sides of the lake where it is narrowerl to a point and forms the Fhone, is excedingly phasant and advantingens for tratie. Fomarry, id. was surrounded ly walls, anl consister of chisters of narrow and ith-drained strects: lat sine the aceession of the democratic party to power in $184^{\circ}$ (sce next article), a most extrandinary change has been effectod, and chicily through the energy and enlightened riews of 3. James Fize, a wealthy native proprictor. The ancient ramparts have been removed, streets widence and will paved, new and commodions quays constructerl along the shries of the lake and river, and at spirit of improsement introluced which points to a great extension of the city. Anong the latest imporements is the eonstraction of a breakwator, within which, as in a harbour. stam-boats are received and lie in safety, and from which they depart seworal times dialy to the principal ports on hoth sides of the lake. The two divisions of the timm are conneeted hy several woolen bridges, and at present ( 1562 ) a new stone hridge is in the course of eonstruction. In rushing through the town, the lihone parts into two branches, forming two islands, on one of which still exists an antique and picturesque cluster of builtings: on the other, laid out as a public pleasuregromm, there is a statue of Jean Tieques honssean, who was a mative of the town. Stretching along a part of the new quay, on the left side of the Thone, there is now a pmblic promenade laid out as a jurdin Angluise. As forming a central termimus for French and Siwiss railways, A . is a favourite resort of travellers, for whose acommodation there are several large anm splendid hutels, commanding tine views of the lake and mountain scenery in the environs. The languge spoken is French. The principal edifices are the cathetral church of sit lierre, which dates from 1124; the town-hall; the college, foumded loy calvin in 1558 , and containing a library of fo,0oto volumes; the Mnsée lath, so called from the name of its founder, Genemal liath, and containines good pictures; the olservatory, the finest in Switzerland; and the masem of natural history, contanimy De Saussures geological collection, ilaller's herbarim, the fossil plants of Irromiart and Decaulollo, \&c. The miversity (oriminlly restahlished in 1:36S, and renganised by (Calvin ant lecou in 1039) has four faculties-theolngy, law, sciener, and helles-hottres. Anong the may handsome new public buidings may bementioneil the loost-office, a Catholic and an English church, this last aceommodathy the large mumbr of English resilents and casmal visitors. 'The stajle manmactures of the town are watehes, musical-boxes, and jewellery; and for the sale of these and other fancy articles, there aro many attractive shops. Altogether, $(\mathbb{i}$. is to le consilered ats und one of the most prosictous and improving
towns on the continent. In 1sio, the popmation uf the city and suburbs was 41,756 . $(1870-46,753)$.

GENEVS, a canton of switzorland, in the southWast of that eountry. is lomuled on the N. by the conton of Vand and the Lake of Geneva, and on the $\therefore$., L., am W., ly the teritories of lrance. It has an area of 100 square miles, and in 1860 it had 53,30 inhabitants, of whon 42,35 were Catholics. It is watered by the Rhone and the Ame, which unite alout two miles from the south-west extremity uf the Lake of Geneval. 'lhe surface is lilly, and the snil, not naturally fertile, has leen rendered so by the industry of the inhabitants. The political aflars of the canton amb city have iundergone rarious changes, the last of these being a revolution in 1847, when the ohl aristucratic party was overthrown, aml a democratic and progressive party attained to power. Long incrt, and in a backward condition, the administration is now most active in developing the resources of the canton. According to the constitution of 1847, all male citizens of 21 years of age exercise the right of electing representatives to the eantonal conncil; the age of members of which must be at last 25 years. 'There is a representative for every 666 inhabitants. The executive is confuled to a comeil of state composed of 7 members, nominated for 10 jears, but eligible for re-election. The constitution guarantees civil and religions liberty, all forms of worship being allowed by law; lut the majority of the citizens pertain to the Reformed Calvinistic Church. The chicf hranches of industry are agriculture, and the manufacture of articles of lyjouteric and watches. About 100,000 watches are made anumally, and exported to Franee, Findand, ltaly, and elsewhere. Musical-boxes, ehronometers, mathematical instru. ments, de, are also made. The chicf town is

GENEVA, a village uf North America, in the state of New York, is delightully situated at the north-western extremity of Sonca Lake, 200 miles west of Alhany, and 50 miles solth-east of Rochester. It is handsomely lwilt, and commands a magnificent view of the lake aul the surrounding comintry. Its prinepipl institutions are the Episcopal ehurch, a Guthic structure in stone; the Genera Medical College, aml the ILohart Free College. This institution, called the Gencra College till IS52, was estallished here in 182t, and in 1855 it had five professors besides the president and 96 students. 1'op. (185.5) $505 \%$.

GENEVA, Lake of, or the Leman Lake (Lacus Lemanus), sitnated hetween siwitzerland, to which the lager portion bedoness, and the recently acquived teritories of lrance. It lies 1150 feet above the level of the sea, and extends for rather more than (a) miles from cast to west, in the form of a crescent. Its greatest breadtli is eight miles, and its depth between Evinn and Ouchy is 920 feet. This lake at some perionls of the year presents a curious phenomenon, whith has never been suth. ciently accountel for, the surface, especially near Geneva, rising and falling through a space of from two to five fect in the course of about 25 minutes. The lake, which is never rutirely frozen over, abounds in fish, and screal steamers ply upon its waters. The shore on the side of the Pays de Vand is celobrated for the beauty of its scenery; the smathem French shore rises solemn and stern, with the montains of savoy in the backgrond. From the Lake of Geneva, Nont blane is visible, and although 60 miles distint, is often reflected in its waters. The Rhome cuters the lake at the upper rom. turbilland yelluw, and leaves it at the town of Ceneva as clear as glass, and of a deep, blae
tint. The lake receives about 20 streams from its northern shore, none of which, however, are important.

GENEVIEvE, a saint of the Roman Catholic Church, the subject of many ${ }^{\text {oppular and highly }}$ peetical legends, and regarded with special veneration in France and particularly in P'aris, of which city she is the patroness. From a nearly contemporary life of st G., we learn that she was born in 42. , in the village of Nanterre, near l'aris, where, as a mere child, she attracted the notive of Germanus of Auxerre, who passed a night at Nantcre on his return from Eritain in 429 . Germanns is said to have marked her out as specially destined to a life of holiness and purity; and the child, partly from her atural tendency, partly, perhaps, under the intluence of the counsel of so holy a bishop, devoted herself to a life of vircinity and conventual seclusion. On the death of her parents, she was removed to Paris; and ber active charity, and the extraordinary reputation for sanctity which she acquired both there and in other cities of France, which she visited on missions of Christion benevolence, won for her the admiring veneration, not alone of her own people, but even of the heathen nr half-converted tribes, which, about this periow, atter a long series of strnggles, had begno to amatgamate with the ancient population of the foman province of Ganl. During the Frank invasion moder Chideric, G., with her sisters in religion, set out on an expedition for the relief of the starring city, and successfully conveyed to Paris an abundant supply of prorisions. The city, when taken, was treated with special leniency through her intercession with the king, and many captives obtained their liberty at her prayer. On the new alarm for the safety of Faris, created by the news of the march of Attila and his army of Huns, it was proposed to abandon the city ; lint G., assemling the matrons and consecratel viggins in one of the churches, exhorted them to avert, iy prayer and fasting the threatened calamity: The unexpected alteration of the direction of Attila's march added still more to her reputation and to her indmence: and it is agreed that her persomal example, and that of the sisterhood to which she belongel, appealed, with no inconsinerable effect, to the natural sensibilities of the rude races which now found themselves, for the first time, in contact with the lnuarnising intluences of the Christian religion. St (t. enjoych, to an extreme age, the reverence and love of the entire people. She dial in 512 at the age of so, and her memory is still aflectionately described as the type of all that is purest and most elevating in the conventual life, as well as of all that is most aulmirable in the works of charity and benernlence. with which, in the active orders, that life is habitually associated. Inder her patronage, and with her name, a religinus congregation of priests was founded in the 10th c., which, with some ricissitndes, continued until the Fevolution. A religious congregation of women, under the name of " Sisters of St Genevieve,' was established in $\mathrm{H}: 36$, chiefly devoted to the care of the sick and the education of young females.
GENGHIS (Jengueiz, Tehineris, or Zingis) KILAN, origimally called Temmjin, a celechatei Mongol conymeror, Lorn esth danuary $11 \overline{5}$ A.D. at Deylun-lclatak, near the northern bend of the Feramuran (Ioang-Ho), was the son of Yesukai Habalur, a Mongol chicf, who ruled over some thirty or forty families or clans, called the tribe of Xeymin, who dwelt between the Amur and the great wall of China, and pail tribute to the khan of East 'Tartary. On his father's death, he did not
besitate to assume the reins of government, though only 13 years of agn. Sume of the sulbect tribes revised to ohey him, and chose another chief helomging to the same family. A war of several years duration was the result, at the termination of which he was compellet to retice to Karakorum, the capital of Purhral Lnuh Khan, monareh of the Keratit, and place himself ander that monarch's protection. Ungh-khan wave him his danghter in marriage, and appointed him to the command of lis amy , in which capacity $G$. gave proof of great military talent. conquering the Mckreit, Taujut, Jelliwin, and other neighbouring tribes. lint UnghKhan, becoming jcalou of his growing reputation, and urged on by envinus courtiers, orileret $G$. to be assassinated. The latter, bavine talien counsel with his relative aul chief councillor, Karatehar Nuyan, a youth of his own age, hut renowned in Tartar history for his wiselom, resolved to depart for his native country, which, after many hairlreadth escapes, he reached at the head of 5000 cavalry. Tiaising au army, he marched against his father-in-law : aml Tughrul, vangushed in battle in 1203 , sought refuge among the Naymans, but was slain by the ghards stationed on the frontiers. G. immediately seized upon Toghrul's dmminons. In the following year, a number of Tartar tribes, alarmed at his increasing power, formed a powerful league against him. The command was giren to Tai-Ungh-Khan, chicf of the Naymans; but in a battle fought on the hanks of the Amur, (i, utterly ronted his enemies, slew their leader, and hecame at once master of almost all Xlongolia. Grander views of conquest seem nuw to have arened before his risiou. In the year loug, he eonroked a kouriltai, or general assembly, on the banks of the Onan, a tributary of the Amur, flowing through his native lamd. This meeting was atteuder by deputies from all the subjugated hordes of Tartary, and 6 . contrived to obtain a religious confirmation of bis designs. Lp, to this perind, he had borme the name of Temujin; lut a renowned magician or priest. surnamed Bout-Tingri ( Som of Heaven'). rencrated ly all the Dlongols, now came forward and pronounced him Ciengthis Khm-i. c., greatest of khans, or khan of khans, declaring that he should rule over the whole earth. The deputies were duly impressed. Abuout this time the Eighurs, an agricultural and civilised people, inhabiting the cometry at the sources of the Hoans-11o and Yang-tse- Kiang, volumtarily sumbitted to lis sway. From this people, who lroifessed Endahism, the Mougols would appear to have acquired a knowledge of writiog. They ahpiten the Eighur characters, but preserved their own langage, and G. selpeted one of the newly-submitted tribe to instruct his children. The next important incident in his career was the conquest of the northern portion of china, called Khatai. The immediate canse of the war hetween 1. and the cmperor of thina, Tchong-Het, was the refusal of the former to rucognize the latter as his suzerain, or licge-lond. Host of the Tartar tribes which ( $\%$. had subdued were really trihuthrios of the Chinese empire; and fchong-Hei, though not interfering to prevent the conquests of the llongols, now wished ( t . to acknowledge his supcriority ly paying tribute. (i. immediately prepared for war, sealed the great wall in 1:ll, and aiter a series of bloody and protracted campaigna, Pekin fell into the hanls of the harbarians in 1215. Dleanwhile $(\mathbf{i}$. was called linch to Tartary to fuell certain insubordimate triles, headed hy Gutchituk, sim of the chief of the Naymans, who hat recorered his ancestral dominions, and also conquered those of the Gur-Klann of Kara-Khatai. conquered those of the Gur-Khan of hara-knatai.
These tribes were nearly exterminated in a great
 taken rofug in Thrkestan, a vast purion stretching irum limke l, wh, m the midde of Tamture, westwaril to the sea of Aral. Hore he suceceded in making himself superme suler, hut only th luy swit away by the victorims Mongls, mow presing westwarit in an ier wistible torrent. It henith ti. ramenel tha show, the morth eastem houmary if the empire of Khaurezm or Kharism, whexp inler, Ala-uldin Mohammed, was one of the most puwerfal sonereigus in Asia. The dynasty to which he belonged han risen intol lower through the weakness of the Seljuk sultans: and its sway now extombed from the horlers of Syria the the river thatus, and frum the river sihm to the Jowsin Gulf. The murder of sime Monged merchauts at Otrat, as town (ond the sihun, affordel is: a pretect firr invasion. He immedately duspatched his chlest som, bijy: at the head (ateoriling to Eastern chernichers) of
 in 1019: and :ifter harine overthown the Tartar allics of sultan Mowmed, and fought a lone and homy lyatelc with the sultan hamelf with mo decisive result, capturewl cunarkaml, lokhara the valualhe libgary of which he destroyed), and and the uther important citics of the conntry. The Ampents, in three s.parate divisoms, nuw scoured aul ravaged bibaurean in all directions. In the course if tive un six years, they owertan the whole of Persin, subucurif the inhainiants of the Caucasus, crussel into linssia, aml flumlered the laud letwen the Widmand the Jhacper. Nor were they liss successful in the east ; the whole of Southere Asia, as far as the Sutlej, exprowneng the misuries of their devantations. Simbuess, disease, and exhanstion at length enfeebled the Monend hordes, and compelled of. to return to Karakurnm, in Tartary, the eapital of his cmpire, in latet. During his alsemee his generals had lwen prosecnting the Chinese war with the greatest sucuss. (t., thumgh well-alvancell in years, was still pessessed ly the old thirst of compuest; and havins rocruited his forces, he led them arross the great desert of Cohli to the kinglum of Tanjont, in the nuth-west of China, the eapital of which, Nin-lia, he bestesuld. Thisheartened lay the luss of the greater fart of his army, the king of Tanjout promised to capitulite at the cond of a month: but in the interval 1 , died. the :3th Augnst 1227, on the hill Lion-pan, worn cut with years and thils. (i) is sail to have had five humired wives and concubines, and th have loft a great mumher of children, amony three of whom he divided his eurmuns prossessions. The third son, Ouchtas, was apmoned 'Grand Khan.' and receivel for his slare the country now ealled Mongelia, with Khatai or Aorthern China as far murth as the month of the Amor. The seemad sim. Tcheolhatai, reecived Turkestin morth of the Ama or J.yhum, and was comonitted to the gnarlianslip,
 Keptelak, and all the country west ani nouth of Thokestan, an immense tract extonding from the Caspian Nea alunst to the Nurthem Oecan.

In the course of his samonary career, (f. is sain to have destroyed, ly wars and massacres, Ju) fewer than five or six millions of human beings. His crmquests were swerally accompanied with acts of alphalliny lailarits, yet we seem to trace thrugh the dreadiul history of the man some indications of a civilising temidenes. Himseli at Monothoist, is stern believer in Gond after the fashinn of Mohamed, Le nevertheless therated ath rolquas : excmptell frum taxes and military service Ihysicimes and prists: male whligatury the prawthe of huspitality ; establushed setere laws curainst
adultery, furnication, theft, homicide, \&e. onsanised as syatem of f "st.al commanication throwhent his cminnus duminions (mands, no doubt, for military furpuses): and so theroughly urgansen what wic maty call the palice or civil :utherity, that it wats saill one misht travel without fear or dinger from muc whl wh his empire to the other. He would also appear to have hate a respect for men of harning and virtue, and to have retained seseral of such :hunt his jurson. The winly memorial of (a. now known to exist is a pranite talled, with a Monged inscription (leciphered lis sclanilt of l'etersburs). diseosered among the ruins of Nertsclinsk. This taldet had been oreated liy (: in commamoration of his conguest of the kingdinu of Kara-Khatai.
 Italian races, sumii were motecting spirits, who acempaniel every ervateld thing from its origin to its final decaly like a seend spinitual self. They were appropriated nut only to men, but to all things animate and inaminate, iunl more "specially (1) Piaces. They were regarded as eftluences if the livinity, anil were therefure worshiplyed with divine lumurs: : sacrifices were amually made to them on varims oceasions, espectially on lirthlays, anil during the prevish of harsest. Nay, Jupiter himsdf was called the genins of men, aud Jume of womm. Kot only hal crery individual his genius, hut hewewise the whold [emble. The statue of the matimal gemins was flacel in the vicinity of the Ruman fortun, amd is diften scen on the coins of Haulrian and Tragim. The genius of an individual was representel ly the Jimmans as a figure in a towa, having the heid veiled, and the cornucopia or patera in the hams; while loral genii appear meler the tinure of serpents cating frit set before them.

 resmblance to the whl Italian gesiii. Their Jrepner Aralic name is Jyima or dimn; and there serms to have been no bettior reasen fur trankitime the word ly the Latin tern genius, than the casual similarity of the sounds. The worit lifinn is from an Aratic root, signitying tu 'vell' or 'conceal, and properly denotes an 'invisible leing.' The djims, or Wastern Herii, are, in fact, rewarded ly the Arals and l'ersians as an intermedate class of heings betreen angels and men, ani inferiur in dignity to buth. They are deseribul in petry as the subjects of a certian Jin Ihn lian, anm as inhaliting the world lefore the prescont race of human heings: but they having excited the anger of God liy their rotselliom, he sent his favenrite angel, Misaris, of accorling to others, Azazel. to pumish amb govern them. Some time after. Hharis himself rebelied, wherempon Gend condenned him to eternal punishment. From this perioh, on accument of his despair ur his apostasy, he was called Elblis or Thlis. The rijuns can assume, in an instant, any form they 1hease, whether of man, hrute, or monster, the last -in accordance with the pepular view of their wicked character-beine the one most fremuently selecterl. Such as have read the Arabion Sights will have a vivid recollection of the hideous and gitantic shapes moler which the genii are wont to manifest themselves acempaniel at times with smoke and thumberings, to terror-strieken mortals. They are in ne degre, whatever treardien spirits like the gemii of the ohl It Ialias: on the contrary, they are inimical tor man's happiness, and can only li. suldual ly the spetls of pherefful magicians. Sice lisulusis: cpmars. The better-informed Ensterus. howeser. do not helieve, it is saif, in the antual existence of such brimgs, The Mussuman docturs, it is truc, affirm the existence of djinns
as an invisible race of supernatural licius, who carry out the purposes of Deity, hut they mocet altugether the protestue and repulsive inventions of the Arab, and F'ersian romancers and I"sts.

 indication a very poor soil. The Gemato of Jimpil amd other loman classies is sumponel to be 1 . Minponica, a mative of the south of lirnge, with branched still spines. Gim is said tu be it celtee word, signifying a shrul. The name flatarenet, is from Phente Couister: lat what phant was inteminel, and whether the chman furze or al shecios of Geniste, is nut su certalus.

GENSTIVE, tha name of are of the 'eass" in grammar (sce Declensins). In when an expressinu as (Lat.) repis filius, (Eng.) the kimis som, the form regis or King's is calleal the genitive case ; aml acomeling to the usual explanation, this name was given it, because it inlicates the suurce or origin of the thind joined with it. A much more satisfactory account of the origin of the mame, and of the ral mature of the genitive ease, is that given hy Max Diallu (Science of Lannuaf). The terms of grammar were originally applied, not to the parts of spech, lint to the elements of thonght; they were lowical terms before thay were grammatical. Lons before the now familiar grammatical distinctions of singular and phurah, of sender, case, vice, \&c. han hem thought of, the Grek writers on dialecties, in analysing the different jarts of an expressel thomght, hat distimenished the primeipal notion-the suliject or mominative as it is called-from secomary on dependant notions; the dependency of the latter they expressed ly the worl phosis. (lat. rowen), a fall or leaning of one thing upon another ; and in such a propesition as, "the ling's son is deal,' the y imd atend the exact nature of the dependence liy ealling it the fonike phesix, i.c., the case shewin! the genus, kimit "r class-the genoric case ; fur while the name" sun" is applicable to crery man having parents. 'king's son' is limited to the class of sons having kines for their fathers. One name joined to another in this rofation has thus the same offect as an Aljective ( $¢$. - ) in limitine its application. It secms probahle indeed, that the termination of what we now all the genitive case, was miginally the same as that by which arljectives were formal from mons. This names thus applipi to ibleas were ly the Greve grammarians of Alexandria transforrell to the worls expressing then, and were afterwarls translatel into their Latin equivalents ly the direek grammarims who tanght their lagguage to the youth of home. lint liy this time the terms had hecone strictly techaical, ame their onginal sinnification little thought of ; and this may account for the Greck genike, the Latin equivalent for which is frombis, being rendered by gritious, generating ir frolncing, which woulh have becn expressed in (iveek ly fonntike.

In English, the genitive is the only case or relation aumongouns expressel by a difference ni termination, and even it is often expressed by the $p^{\text {reposition }}$

U!' as the rimors hink, "r the brink of the pion. Fran the froghery with which the form in 's imbleates that me thing belmars tor another, it is ofton callow the powsesion cass. lint this nane is

mambe af the intelloct, still of positive value and of leal importance-namely, the powers of acequime and repmbeing what has hen alrealy pradued.
 calueated skill in the ermmon ats on in tine ate may "evist in a high dereree, ame may evon eomfer hasturtan on the imbudual and serve useful pronens in life, withont the acempament of mfinality. 'The prase implied in the name - talent "word lie conferded tos the lent examples
 fion. This hamishes the mont respetable ewntrast (n) entus. being itseli something onlmiralle and merturimes. A less istecmad contratst is furnished ly the crowd of imitntons that follow in the wake if any ereat and origual mim, wher aim at producing similar eflects withost the inward spontamity of the master, ame with only the resource of enfring his external form and pectiarities. There is is lime of alility amomeners to talat in this f"wer of imitation, sum liturature always contains loth emed and indifliont examples of it. We are wenstmed to speak of pectanters, playwizhts, and eopyists, mmony the writers uf pery literary period. The imatators of lonace in his inw time have not survised; but he, as will as every other great anmins, may be tracked in sulsequent compositious. spenser's sehool of puctry makes the largest section of the published $j^{n}$ mas of the century succeding him. Pope impresset his style ujum list entury : and Iohnson's balameet grose continace to be reproduced hong after his death.
The meaning of gemins luing thas moterstom as referims to origimal mativeness, "r inventive power, it has heen emsidered a problem of interest to trace it to its foumdations in the mint, with a view to determine whether it lre a distinct fiteulty, or only a sumpror degree of other recognised $l^{\text {wowers. }}$ Johason's detinition is well known: "large general phemers turned in a partiendar direction.' "This negatives the idea of a speeitic embownent, ant wouk seem to imply that the man uis mins enuld be anythim that he jueasel; that Aritutle might have been limlar, and Homer have liseovered the forty-seventh of Euclid: an assumption in the last degree improballe, if not rerging om alsurlits. There is a class of mimis noted for versatility, hut they are only a select class. Cusar was a grneral, an orator, and a writer, besides being a pulitieian of mark, whetler snecessful or unsuccessfut. But, accorling to the must enlightenel theories of the prosent iny, it is usual to consider luman leings as born with distinctive enlownents: and although there is a common mental organisation at the basis, yet this is sumpesel to have it pluazlity of listinct functions, my one of which may rise in degree without the rust. Thas, intellect may le $]^{\text {wowerfud }}$ on the whone, withont involving a prophtionate intmsity of the feelings on the volition ; the sensibility of the ear may lee acute, anel that of the eye maly arerage. Now it would le fair to suppose that chans in whe line-as, for exmple, panting-would result from the unusual amomentation of the susecptibilities and powers specially exercised in thar art; the: semse of coldur and of form, skill of hand, and a gend reendlection of thase objects of nature and haman life, that are the tithomateral of a manter"s manfositions. Sa a pret should have a more than fommbin for verse, phenty of languare, tante for the anmariate imane of poetry ind so ont In this way we minht, ly a kimh of analysis, detomine whim if the ficultios common to all men shomble bo "xaltmi to in sulpuin pithl, in eriber to fumish it tumbs in "anh scparate walk. This methen has
 spectiturs, and is fand
of haming the suldjeet. Examples maty be seen in Bain on the stuly af Characher.
 was lum at Champereri, near Autun, in Burgundy,见ith Jannary 1:46, of an ancient but reduced family: Ilor maden name was Ducrest. At the age of 15 sho was married to the Comate de Cenlis; and in 1750, throngh the influcece of her aunt, Madame de Mhatesson (who had been privately married to the bue dorleans) was male a. haty-in-wating in the honse holl of thar lunchasse de Chartres. In 1752 , the lue de Chartres, afterwards known as Egalite, "fpumted her 'grvernor' of his chilhten. This apmontment gave rise to certain scandalous reports, the truth of which subserfuent circumstances appear to have contirmed. Niatime de G. wote a variety of works for her pupils, among others, Théatre à Pusuge ales jetmos persommes, ou Thádite d' Elucation
 sur C Eelucation (1782); and Les I'eilless du Chatun, "he Cours de Morale, de l'usaqe des Enfants. On the lireaking out of the Revolution, Matame de G. took the liberal sido, lint was ultimately eompelled tor seck refuge in Belcium. Afterwarts she went to Switzerlane, and in the same year proceeded to. Nitma, in Cirmany, where she wrote a romanee, entitled Les Chupaliers du C!ume, ou la Cour de Churlomayne: and also Précis de la Conduite de Mathme tle (romlis prndemt la Rérolution, as a sort of refly to the arensations of her numerons enemies. When Bonaparte hecame consul, she returned to lanis, and received from him a pension. From this time she resided constantly in l'mis, puhlishing in rapisl succession ane book after another till her teath :ilst December 15030. Matame de G.'s writings amoment to about 9 wolumes. They are chiefly thescriptims of incilents in fashmable society, with which she was theronghly acquantet, and which she pianted in lively chbiars. Is she advanced in life, her writinus became more and nore polemical ani ill-natured. Her observetions Critiques pour arreir a lHistoine lithrative du 19 me siocle az vols. l'aris. 1818); and her Dictiomairc Critique ot ruivomes des Bitiputtes de la (our, des usogps dit Mond., \&e.; and her Diners du Baron d'Holbach, sulbjected her to severe critieisn. The last of these eontains a great deal of curions but malicious information roneerning the freethinkers of the 18th century. Nevertheless, her writings have heen very jopmiar, and have passed thrugh several editions. Iler voluminous Mémoires were written after she had reached her s0th year.
GENNE'SARET, SEA or, called also in the New Testament, The Sra of Grlilee and The Sea of Tiberias (from the city of Tiberias), and in the OH Testament The seat of Chimuerth or Cimproth, from an ancient town of that name sitnated on or near its shores. The word G. itself is sopposed ly stme to be merdy a comaption of Chinnereth: lnit uthers derive it from Gamnah, a 'garden,' and Sherom, the name of a plain, letween Monnt Tabor anl the lake. The Sea, or rather, Lake of $\mathbf{G}$. is ahout $1:$ miles long and 0 broal. It lies in the lottom of a great basin, and is undoubtedly of voleanie origin. Alhongh the Jordan runs into it rof and tumbin from the north, and many warm and hrackish springs also limd their way thither, its waters are conl, clear, and sweet. Its shores are also emlivened with sparkling pebles Now, ats formerly, it ahwands in tish; lint the fisheries ar" ahnst catirely neglected. The surrounding sumery is net wry lututiful, lut its associations are miong the ment sucred in l'alestine. "Where'er w, treal, "tis hamitul, holy gromal.' 'Like Jeruvalem, the Sea of Gemesaret is eushrined in the

## GENNESARET-GENOA

heart from chillhond. The home of Christ-"His own city"- Capernamm, lay on its shores; many of His miracles were ${ }^{n}$ erformed around and mon it: lle tausht the multitules that followed llim, on the heights over it, along its pelbly heach, and from a boat on its surface; most of the apostles were lishemen, whe here gained their daily breal; and one of 'larist's last earthly inturviews with them, after the rmuifixion, was on that occaxion when, driwn molrally by neessity, they han temprarily resumed their ohl occunation, and had

 the time of Clurst, the region romat alont was the most densely pepulaten in Catilee. Nine citios and thwns stoot on the shores of the laks, while the nesighburing plains and eminences were dottol with mumens lare villages. Of the mine ritios. seven are now uninhalited ruins; hali-a-dozen mud-hovels are sufheient to house all the human life at Magiala, and only Tiberias continues to exhibit some fechle traces of its former prosperity.

GENOA (ltal. Cifmore: Fr. Cimes: anciently, Gemut), a eity of ltaly, sitmated on the DID iterranean Gulf of the same name, at the foot of the A pemines, 79 miles sonth-east of Turin, is the chief commereial seaport of the Sordinian prorinecs. Lat. of hoht-honse, $44^{\circ} 24^{\prime} 1 \mathrm{~s}^{\prime \prime}$ N., lumg.
 119,610; that of the province of which it is the (apital, $6+3,880$ ( 1871 -pme of town. 1:01:90.)

From the sea the aspect of $G$. is a splemid pranorama; the slopes of the hills down to the shore are covered with jalaces, churches, hotels, and private dwelliags, reheved ly terraced gardens and grows of orange and pomerranate trees; while the havk summits of the loftier ranees are capped with forts, batteries. and outworks, which constitute a line of furtification of great strength and cxtensive circuit.

The tiue harbour, of which the dianetro is rather less than a mile, is semicircular, and furmed by two piers, at the extromity of whe of which stanis a light-house tower, 300 pert high. Vessels of the larest class can enter insile the harbour, and, notwithstanding the heary swells weasioned ly sonth-west winds, the harkon is remarkably safe. As yet, however (1862), there is mo landing pher for passengers, all of whom, at consilerahaijncomentenes, are carried ashore a distance of nearly half is mile in ruw-hoata. Subjeet to this drawhack, the harbener is wisited daily by prench and latian steamers in communic:tion with other ports in the Mediterranean. It is anticipatent that the inerease of passenger traffic consefpant in the "pening of the railway to 'Imin, which has alreaty given rise to sumhy improvements, will canse this defect also to le remedied.

Several important establishments are grouped round the fort-riz, the arsenal, the convict 1rison, the chstom-house, and the Porto Franco ir freceport warchouses, where merchanlise may be stored previons to its reoxportation free of duty. G. is the great commercial nénit of a wide extent of country, of which the chice raw exports are whe oil, rien, fruits, cheese, steel, \&e: the manufactured ghoils exproted are velvets, silks, damask, ghoves, finwers, parer, sup, jewellery in silwe and coral, in all of whech industrial limaches the excellence of the fennese workmen is incontestahle. The improts are mincipally cottons, raw eotton, woollens, cochincal, indiga, grain, hates, \&e. The annual exports of $1 \frac{1}{5}$ are ralued at $x: 000,000$, while the imperts are returned at ang (100,000.

Whate strikingly grand as viewed froms the sea, and so far worthy if heins entithel Lee superke, a closer cxamiation of G. tends materially to lower
its character for beauty and magnificence. Hemmed within walls, and hilt awkwardly on irregular rising grombls, it has never leen ulpend up by any comprehonsive fitn of improvement, ame remans very mucla a labyrinth of narow and intricate lanes, accessible maly to forot-pasengers, or to the markmalus, liy the use of which a lare prortion of the internal gonds tratie is comineted. Thuse thorouchfares, into which the licht af day imperfectly penetrates, are lined with tail lnillinges, some of them of marhle and of handsome architecture, but the y can with diffienlyy he seen from the limitelness of the space in front ; and huwerer gram, they eonsequently fal in eflect. Many of them-nice the residnce of merchant-prinecs-are now transformed into hoteds or hasiness estahlishments: in some cases, the superl) loblies, emvironed by marlbe columes, boing meanied ley pety tralers, and shablay in the extreme. Unly is fow strects are wide rnimgh for carriages, and in thes the aspeet of atlans in mere like that of monern cities. Frallen from their hich estate gnorally, severad palizzos still lowner th fersons of distinetion who lase the mons of maintaining them in their onginal splendour, or they are appopratel as puldio lmidimes. Tlat two mast framons and the lalazo Ducale, formerly inhabited ly the doges, now appopiated to the maetmes of the senate: and the lakazo lhorin, prasented,
 whase wsiduce it was during his presidency of the lepmblic. The palaces brionole sale, Sora,
 many others, prosess preat interest hoth on acomme of their historical fane and architectural beanty. Many of them contain galleries of paintines, whel are shewn for a fer. Some of the churches are farticularly fine: the most noticeable of all heme the eathertial of Nit lorenos, in arand and pile in the Italian Gothie style. (i, contans may pxeellant pmblic institutions, which almost all data thom the period of the remblic. The areathountal, and the asylam for the por (Alluerge the' Pareri), are especially worthy of mention. The latter makes provision for 16 iot persenc, orphans and ad peophe. The former are trained in to useful moboyments, and such sirls as marry one of the hospital rective a small dowry. The dat amb dambensttation, aml the lusintal for the insane, are the tirst in ltaly in point of extent and resulation. There are nomerons excellent fommations called conservetorio, dewome to varinas phanathronic propests, the chief of wheh is called the frieschnes, and is an asylum for fomate orphas. The patdie labrary contains 50,000 whumes. and is untestrictenly ionen to the public. The deamony of lime Arts was fonneleal hy the Ibriat family. The theatres of $(A$, are riry tine, that of Cario Felice ranks amoner the hest in ltaly.
The Gienese are a shrewt, active, lahorious race, and possess all the puthetes of a commercial and maritime commonity. They make skiltul and havly seamen, emorgetic trallers, and thrifty hushanduen, and are stull rmarkable for the spirit of enterprise and freedom which so strougly characterised the meriod of the republic. Clamines Commbus ats a native of their eity, they are now ergaged in rearing a phlic monnmont in homour of that distinwhished mavigator. While the main busimess of the town is evilently maritime, there is also an extensive trade carried on in the mimfacture and sale of a pectular kind of jewellery. This consists of remark. ably tine tiligree-wark in silver and solver gilt, which resembles that of lulia, and is fully as precions in frint of intrinsic values, New of the many tomists who pass throunh di. fail to pmrchase one or more of these pretty and chenp articles of bijonteric.

(:FNOCILLARE, a tum in Fortitiontion ( $4 . \%$ ) for that part of the parapet of a battery which lies moler the embasure. The mame is arived from Fr. foom, knee, as representime the ombary lefirht of the semonillere above the platform on whith the ghm is worked.

GENHEDADNTNG, a term terival from the

to distinquish any special branch of painting, as genre historiple (historic paintingr), yeme (lu poysage (landseapepainting), de. la a more definite sense it is nsel to describe any picture containing haman figures wot incluted in the su-called historical class, particularly phetures with fizures much behw $^{\text {bin }}$ the size of life-cattle, architectural pieces, thowerpieces, and representations of still life. Inler the teron geme-pictures are emmplended all fictures with figures representing individuals only as types of a spucies or class, in eontrabietinetion to historical compositions, which hring before us rertain indiciduals, or, as it sere, noming prowie. The monle of conception aml style of rxechtion in genrepainting may resemble tho histrical style: amb, on the ther hand, historical permases may hir depresented merely in sithations of evershay life. The term histuriceteme is euployed in lwath eases. The Freuch likewise distingish the !ome. hinomique from the lower wemer, strictly so callend: thry also oceasionally apply the term pirmon din style to historical panting. Cenre phetures aro nsually of limited dimensions, while in histomal pictares the timures are commmiy the size of life. or even culossal. In either cas. howerer, there are many exections to the general me, and the proner desinnation depents rather on the style of subject than on the siza. A specine of genrepanting with it distinct style was practised even in aneient times, lat the fintlypace of the presunt enne gicture in the north, wan more particularly the Netherlands. The Italians, orpeially Paul Veronese, hat previonsly showel a leanins to the geare style in hidhen-historical fintures, by making the prineipal tigures and the action suhorlinate to the accessories and locality-as, for example, in his 'Marriage at ''ana;' and Jan Eyek's sehuml in the Netherland's had likenise introduced the same element into the aldineation of inciteats in sacreal history: Lueas van Leyden and Allsert Dürer then began to represent actual seenes from the everydiy life of the perple in paintings and engravings (ienre-painting was broucht to its hiohest perfection in the Netherlamis by a series of almmale painters, such as Terthre. Brower, Ostahe, Jembrandt, the younser Teniers, Metzu, Gurand Dow, and whers Though the characteristic and humons conception of many of the works of these masters gives them a ${ }^{n}$ walian value, it was fomen in other cases that a certain delicacy of initation and skill in using the lonsh was capable of imparting a singhar charm to the most ordinary scenes abil tigures. In the Firitish schome this style of art is generally mulerstomb to be limited to pictures with figures. amd many warks of the highest excollcuce have been prolucel in it, clevated in treatment ly the intruduction of an important elment-vil., thie dramatic.

and $C$. Pannonica, are often mixel with the gentian of commerce. They are deemed inferior. Several species are natives of britain, but none are at all common except Cr.chmpestris and G. amarella, plants of a few inches in height, with small thowers, loth of which are in use as tomics, althongh only in donestic medicine.-G. Cutcsla; a North American speries, is extensively used in its native country, as a substitute for Common (1., and $G$. Furroo is employed in the same way in the Ifimalaya.-Several species of G. are common ornaments of our gardens, partichlarly $G$. acentis, a small species with large bhe lowers, a native of the continent of burnpe ame of Siberia, often phanted as an elging for flowerborders. Of North American suncies, fi. crinitu is particularly celebratcil for the luanty of its flowers, which are large, hue, aml fringed on the margin. 1t has a lranched stem, ant grows in wet gramal. The brilliancy of the llowers of the small alpine specios has led to many attempts to cultivate them, which have generally prowed unsucessful, appasrently from the difficulty of imitating the dimate and seasons of their native heights.

GENTIANACEA, or GENTIANEX, a matural order of exoyenoms phats, consisting chietly of herbaceons plants, but containing also a few small shruls. The leases are opposite, rarcly alteruate, destitute of stipules. The flowers are terminal or axillary, generally regular. The calyx is divided usually into 5 , sometimes into $4,6,5$, ur 10 lunes the corcllar is byporynous (q. v.), has the same nmmer of divisions with the calyx, and a plaited or imbricatert twisted estivation. The stamens are inscetel upon the corolla, altcrnate with its segments, and cqual to them in number. The orary is composed of two carpels, 1 -edled or imperfectly 2 -celled, manysceded. The fruit is a capsule or herry-The species are numerous, about 450 beine known. They are natives luth of warm ame coll climates. but rather of elevated regions in the torrid and temperate zones, than of coll regions near the poles. Many have flowers of great leauty, both of colour and form, the corolla being often most delicately fringed. Nany are medicinal, as (iextian, fumati, Frasera, Beekbeas, and Cextates. See these hearlings.

GENTIANE'LLA, a name sometimes given to the small-flowered or antumnal Geatiom (Gentione Amarella), the beatiful blue flowers of which alorn some of the dry pastures of Britain; hut more conmonly to the species of Cirendia, another menus of the order Fientianacer, of which one ( $C$ : filiformis, formerly Escacum filiforme) is a native of Britain, growing in sandy peat-soils, chiefly in the south-west of Eaclami-a small, slemder, anel gracefal plate with yellow tlowers. (f hysopifolim is wath employed as a stumathic in india.

GENTILLY, a populons village of France, in the metropolitan department of seine, is sithated near Paris, towards the south of that eity. The great bastioned wall of I'aris passes through the billage, separating it into two portions, called Grat ancl Little Gentilly. Pop. 15,00\%, who are employed in the manufacture of chemieds, in quarrying, and in washing.

GE'NTLEMAN. This worl is an example of those compromises so frequent in Enghsh between the layguage introduced ly the Nomans, and that in possession of the country at the period of the Conquest. The Noman word was, as the French word is now, fentithomme. The first syllable was retained, whilst the second was almanmed in favour of its saxon equivalent, mem. Though commonly translated into Latin hy generosses, which means a geucrous, liberal, manly person, in short, a gentle-
man, the word gentleman is derived from gentilis, and homo. or man; and grutilis in Latin did not simmify gentle, generons, or anythime equivalent, but butoming to a gens, or known fanily or clan. Sce Guas. A gratleman was thus originally a person whose kindred was known and acknowledeed: which is the sense in which it is still omployed when it is mot intendel to make any reference to the moral or social qualities of the particular indivihal. One who was sine gonte, un the othor homl, was one whom no gons acknowledged, and who minht thus he sail to be ignobly bom.

The term gentleman is contimanlly confommed with Fespuire ( f . $\because$ ), even hy snch learied authoritios as Sir Biward Coke. But they are not equisalent ; and whilst some attempt can te made to define the latter, the former seems in linglam, from a very arly time, to have been a more sucial phithet. Odinarily, the king,' sitys Sir 'flumas smith. 'Joth only make knights and create harous, or higher degrees; as for !potlemon, they lee made good cheap in this kinglom; for whosocyer studieth the laws of the ralm, who stulieth in the universities, whon pro. fexseth the liberal sein-nces, and (to le short) who ean lise idly, and withnt namual labom, and will bear the prot, charge, and emutenance of at antleman, he shatl be called Master, for that is the title which men qive to esquires anil oflor ghth men, and shall be takers for a centleman.'- Commemuo allh of Englumd. i. e. ab. But thoudh sneh was the real state of matters, even in the begimning of the 17 th c ., the worl was still heth to have a stricter meaning, in which it was more nearly symonymons with the French fentilhomme. for in the same chapter the sume writer remarks that 'sentlemen le those whom their llood anl race toth make noble and linown.' Even here however, it searcely scems that los considered any connection with a titled family to lee necessary to confer the character, for he afterwards speaks of it as correspondins not to nodility, in the Enolish sense, but to notbilitas, in the homan sense, and as resting on ohl riches or powers remaining in me stock.' There can be no doult that, in still earlier times, patents uf gentility were granted ly the kings of Eaclamy. There is one still in existence by lichard II. to Joln de Kingston, and another by Henry VI. to Parnard Angevin, a burdelois. liut these patents determine vary little, for they seem to lave carried the rank and tithe of esquire ; and there is no dould that escuires, and all fursons of higher rank, were held to he fentlemen, on the princizle that the errater inchules the less. The ditlicalty is to say whether between an esquire, who certainly was entitled to the character, and a yeoman, who was not, there was an intermetiate class who could Claim it on any cother \&rounds than courtesy and soeial usage. These fratents corresponded to the monern pratents of arms which are issued by the Heralds' Colleres in Eneland and Ireland, and by the Lyon Oftice in Scotlank, and were probably given on the very same grounds-viz, the payment of fees. A patent of arms confers the rank of esquire, and there mobably is no other legal mole by which an untithed person can aequire it, unless he be the hohler of a dignitied otlice. In present, as in former times, it is common to distinguish between a gentleman by lirth and a gentleman by profession and soial recognition. By ab gentleman horn is nsually understood either the son of a gentleman loy birth, or the rrandson of a gentleman by position ; but the $1^{\text {hna }}$ me is loosely applied to all jersons who have not themselves risen from the ranks.'

GBOGNOSY（ $n \overline{\text { B }}$ ，the earth：gnosis，knowlelge） is a torm now little used by liritish writers，but still employed in dermany as is syonym of seology，or， mure properly，as restrictel to the ohservil facts of geolony，apart from reasonings or theories huilt unan them．The geognost examines the mature and position of the rocks of a comentry，withont gromp－ ing them together in the order of succession．Of necessity：geognosy preceded geolugy；it was indeel gonlong in its early emprical condition，when it cemsinted merely of a record of ulserved facts；but as soon as these assumed a seientific form，and wero arranged into a system，then geognosy disulpeared； for fen in the examination of new and unexplored territories，the data surplied ly the science of geolngy enable us to refer the strata with eertainty to their true chronological pusition．

Thu worl has also been employed to alsigmate that department of scology which treats of the physial characteristies of rocks；that is，of their chimical composition，intermal structure，phanes of division，position and other properties，and peen－ liarities belonging to then simply as rocks．

## GEOGLAPPIICAL DISTIIBUTION OF

 ANMMALS．Each great georraphical or climatal region of the globe is occupied hy some speeies of anmals not fonnl ckewhere．＇thus，the ornitho－ rhynelus hedouss exclusively to New llohand ；tho sloth，to America；the hipropotamus and camelo－ parel，to Africa；aml the remelece and walrus， to the arctic regiogs：and each of these anmals， whon Jeft in its natural freelom，dwells within certain limits，to which it always tends to return，if removed ly aceident or desisn．A group of animals inhabiting any particular requa，and cmbracine all its species，both aquatie and terrestrial，is called its Fracsi（ $f$ ．v．），just as the collective jlants of a combry are termed its Flond．There is a close and divions cemmection between the fama of any place and its temperature，althongh comotries with similar climates are not always inhabited by similar animals：and the suil and regetation are likewise impurtant ficcors in determining the characters of any special fama．＇llue intluence of elimate is well seen in the distri－ bution of animals in the arctic regions．The same animals inhabit the northern polar regions of Europe， Asia，int America．Thus，for example，the polar bear，whales，seals，and mume rons biris，are common to the northern regions of these three continents． In the temperate regions，on the other hand，the tyles romain the same，lut they are represented by difficut species，which still，however，retain the same ieneral features．These gencral resemblances often led our carly American colonists erroncously to arply the names of European species to the similar，but mot identical animals of the New World． Similar diflerenees ocenr in distant regions of the same continent，within the same paralled of latitude． Thus，as l＇rafessor Agassiz has remarked，the animals of Oregon ami of Califomia are not the same as those of New Enghand ；and the difference， in some respecta，is even greater than between the animals of Now Eagland and Europe：and smilarly， the animals of temperate Asia differ more from thise of Enrope，with which they are contimous， than they do from those of Ameriea，from which they are separated by a large surface of ocean．

Inter the torrid zone，we not only fiad animals diffrent from thase oecurring in temperate regions hut we Jikewise mect with a fama which presents the $\mathrm{g}^{2}$ atest variety anomgst the individnals which constitute it．＂The most gracefully proportioned

いまし
forms,' says Agassio. 'are fruml lyy the side of the most grotespue, deckel with cerery combination of brilliaut whamiat. At the same time, the contrast between the animals of lifferent continents is more markel; and in many respects, the animals of the diflerent tropical fanas dither not less from ath wher than from thase of the temperate or frozen zonces; thas, the fauna of jirazil varies as mach frow that of coutral Africa as from that of the southorn Cnistel states. 'This liversity in
 inthence of the climate of the tronce ; if it ware xo, mifornity ought to be resturel in promertion as we racele from the trapics towards the antarctic trannate revion. lint iusteal of this, the differ "How's continue to increase-strmach st, that no fannas are more in antrast than those of fape Horn, the Gape of timet llope and New Dublant. Hence, nther inthences mont be in ureration besides these of climate, die-mintucuces of at hichor order, which are involved in a gencral phon, and intumately asstriated with the development of life on the surface of the earth.' If space purmitterl, we might pint ont the inturne of the natnal features of the earth's surface in homing amb sematime fanas. I mountam chan or a descit may act as effectably as the depths of wean in sumation one fana from another. When mo such ubstacles exist, ous fanua gradually merges moto another, withont any cletinite lime of demariation.

The fowers of lewmotion prisessed ly y different animals have not-its we might have sinllusentany alparent inthence on the extent of country over which they rang. On the contrary, animals whose lownotive powers are extremely emanh, as, for example, the common oyster, have a for greater range than some of our Hect animals, such as the monse.

The mature of their fond has an important loaring unn the gromine of animals, ant unon the extent of then distrblution. Carmivorons aminals are generally less contined in their rance than herbivorons ones, hecanse their fom is almost everywhere to be fomm. The herhivora, on the other flatul, are restricteal to the more limital rugions comespoming to the different zones of regetation.' "imilarly, birds of jres, Like tho easte and vulture, have a nmeln wher range than the granivents and frillinaceons hirds; lut even the linds that wander furthest, have their lufinite limits: for example, the eomen of the Corfilleras, althmyh, finn the extreme heights at which le is oftern secon, he cannot fear a low temprature is nurer found in the tomprate region of the linten states.

A very influential factor is the distribution of aquatic animals in thu shpths of water. The late lroicseor Forles distinctly shuwen that we may recogaise distinct famms in zemes of difierent depth, just as we mark differcnt zunco of anmal anit Fratalde life in asecming, dofy mountains. The zond hytes, mollusco, and crom fishes, formit near the shore in shallow water, usually differ very matorially from those living at the nlepth of 20 or © fort ; aurl these, again, are difhrent from those which are met with at a speater" ilepth. The extreme ilepth at which animal hie, in its luwer forms. ceats twexist. is unknown: late researches of $\mathrm{Mr}_{\mathrm{r}}$ Wallich na? - Hhlunse Dilne Eluarls shew, howeme, from the evidence of dop-seab eommeiags, and of pinces of telerraplh wire raisend irum seat deptles, that the region of aximal life exteinds luthemetrionell.! (to use Prifessur Furbes's worl) further than was anticipated.
before cuncluding these general remarks, we mnst olserve that occasionally one or more animals are found in one very limitud spot, and nowhere clse; as,
fordxample, the chanmis and the ihex upon the $A l_{\text {ps }}$. ( 1 ) 1 this punt, the reader shomble consult l harwin's Jonmol of hexectectos, de.. in which it is shewn that the (ialajusens Archipectam, consisting of a small Erour of islands situated umber the equator, and
 Amorica, not ouly contain numerous animals and plants that are foum in $m$ ether part of the worn, The that many , the species are exchusively contined to at sinegle jslamb.)

All the fanmas of the sfole may lee divileal into three great ermps, comespondine to the thre grat Mimatal diviluns-viz, the Arctic or Glacial, the Tompurate, and the Tropical l'aunas, while the two last-maned formas may be agan divided into several zowngical provinecs. latch of these primary divisions demands a seprate netied.

Abetic Faces.-The limits of the fana are easily fixal, as wo ioclude within them all animals living luynd the lime where forsts cease, and are succealed hy vast aril pans, known as baren lands, in thetres. Though the air-hreathing spectes are not mumeros here, the larep number ui individuals comphenates for this leticients, and amons the marme anmals we timb an astmishiner profusion and raricty of forms. The larer mamals which inhabit this zone are the white lear. the walros, numerons specics of sual, the reminer, the mask-ox, the nawal, the eachalot, and whales in abustance. Aurng the suraller species, ve may mention the white fox, the polar hare, and the lemmins. Some marine eagles and a fow wading birds are fond : but the aquatic lirils of the fanily of lalmipedes (the weh-footel livels), such as the gannets, cormorants, junguins, fetrels, ducks, geese, mercansers, and gulls, abound in ahnost incredible profusion. Nin reptile is known in this zone. Fishes are very numerons, and the rivers especially swarm with a variety of species of the salmon family. The Articulata are represented hy numerons marine worms, and by mimute crustactans of the orders Isopodic and imphipmeda: insects are rare, and of inferior types (only six species of insuets were ohsurved in Melville latal dhomg l'arry's resilence of eleven months theme. Only the lowest forms of mollusea are found, viz, Tunicute and Arephala, with a few tiastropoukt, and stall fewer Ciphulopohth. The lidulth are represented hem mumens jolly-fishes (rspectally the luruic) liy several star-fishes and chini, and ly very fow jolytes.

With this fann is associated a peculiar race of men. known in Ameriea unter the name of Esquimanx (q. $\%$ ) and in the Ohl Word under the names of laps, Mmoverles, and Tcbuktsches. 'This race,' says Agassiz "difters alike from the lndians of Ninth America, from the whites of Europe, and the dongols of dsia, to whom they are adjacent. The miformity of their characters along the whole rance of the arctic scas, forms one of the most strikine resemblanees which these people exhilfo to the frana with which they are son clusely connectel.'

Temperate Faccis.- To the efacial zonce which racloses a single fanna, succecels the tenpurate zome, included between the isothermes (or lines of equal mean temperature) of $3: 2^{\circ}$ and $75^{\circ}$, characterisel by its pine-forests, its mades, its walnuts, and its fruittrens, and inlanhited ly the terrestrial hoar, the wolf, the fox, the waisel, the marten, tho "itter, the bynx. the louse anl ass, the boar, numerous femera and species of decr, goata, shecp, new, hares, squirrels, rats, de.; and sonthwards by a few representatives of tim tropical zone. Considering the whale range of the temprate zone from east to west, Arassiz aliviles it, in aceordance with the prevaling flysical features, into-lst, the Asietic realm, embracin! ## GEOCRAPHICAL DISTRIBUTION OF PLANTS.

The island of Matarascar has its peculiar fauna. A large number of species of phatrumana, cheit: optera, insectivara, \&e., are fomm only in this island: and of 11: specing of hirls that have heen inseribed, b.5, or mori than half, are fome nowhere the. We have alranly ruferred to the still more exclusive fauna of the Calapage Islands, which has been specially sturlical by barwin.

From a genemal survey of surli facts as we lave piven in at rery combased form in the proceling colums, deasiz draws the following condusions:

1. Eiels Ganid disision of the olfle has ammals which are either wholly or for the most part peculiar to it.
2. The diversity of famas is mot in propertion to the distane that seprates them. Viry simitur fanms are foud at ereat distances apart while wory dilliment fanas are found at comparatively shon't distancer
$\therefore$ " l'here is a lirect felation betwen the riphness of a fanaa and the climato, and likewise between the fanmand the flara; the limit of the former lwing oftentines deteminerl, su far as terrestrial animals are concerned, hy the extent of the latter.
3. The distribution of animals commot (any more than their oreanisation lue the thect of external inhanees. but is the ratisation of a wis ly d sicmed 1han, by which eath species of animal was originally ercaten at the phace ami for the phace which it inhalhits. The only way to areomet philosenhically for the distribution of anmals az won that them. is tor regaril them as cufuchehomen-that is th sati as miginating on the sail where they exist. There is not a single fact in farour of, inded, all seimentife wherrations are in diret opposition to the view, that the whole animal world was createn in one sincle centre.

For further details on this sulnject. we may refer to the various works of A yissiz, of which we have made free use in the compilation oi this article; to Vomets Zoulogisehe Briefo, wh. ii.; \rs Somerville's Mhsical Geugraply, wh. ii. ; Murys Lat Terve a l'homme; Kluden's Hotulheh dir Plelsiwhon Gomeraphie: and espucially to schmardias Leat work in the sulbject, entitled Die Cicourorphesche Fertreitung lir Thiere.

GEOGRAPHICAL DASTRIBUTION OF
 l'ingormonisapme, is that hameh of loutany whed treats of the seoraphe distribution of pharts, amb romectabotany with physical gemgraply. I knowlodee of facts belongine to it has inem gradually aceumblating ary since the sejence of batany bevan to be sturlien, hut it importance was littie numerstom unth very recent times. Humbalit may The sail to have devated it to the rank which it now holls as a distinet bramh of selened. It was imped impossible for hotany tu be stulied withont attention being amented lig the weat diversity of the pombetions of diferent combtios ant even of thence not very dissimilar in climate. lut it was lome ere impertant peneralisatins were attempted: anl a large aceumbation of particular facts was in the tirst pace necessary. Fwen th this ding the deliciency of information concerning the botimy of whe regions is painfully felt.

Every climate has plints particularly nolytide io it. The phants of the tropics wall nut grow in frigid. nor gencrally even in temprate regions: as little will arctic or subarctic flamts cmure the heat of the torria zone. Anl as the climate clanges with the - levation aloore the level of the sea, the monntains of tropical countrics lave a flora amalurous to that of the temperate, and even of the fripid zones. The regetation of every phice lears a blation to The regetation of every phare bears a relation to
its meas annual temprature. But owing to the
pecnliarities of different plats, it hears also important relations to, the mean tempratures of the smmer and wintir months: and thes ereat dimersitios are foum mat only in the indernoms regetation of combtries very similar in their mean anmal tomperatme, but evon in their suitalle-n-ss for pluts which may lo introducel into them by man. Xur is temprature the only thine of inpmotane in the relatima of minate to venetatim. Whinture mast le ranked arat to it. Some plauta tharin unly in a dry amb sonme moly in a
 uf Africa amh of Austratia is alnome ay nutalidy different from that of muist countrios in similar latitules, as that of the temprate from that of the turrit zoms. Nor is the differmace merely in the suncies of phats pronluced, but in the whale character of the vowntation, which rery much eonsists -ither of suculent plants with thick epidermis, or of plants with hare and dry foliage.

Aluch depends alsin on suil. Fanily soils have their peculiar sentation: feat is also favmurable to the erowth of many lants which ari shlome on nower toble fund in any other soil. The chemieal comstitution of sails eletermines to sman extont the Wharacter of the ir fhora; and therefore certain phants are ahmos excheively talue fom in distruts where certain rocks jresail, ant a relation is estathished between butany and quones. Limestone districts, for examply have a hora diflering to a certain extent from other listricts eve of the same vicinity: Sume British phats ane alust entirely limite to the chalk districts. The other physical qualities of the sonl are mot unimportant. Light suils are suitable to phants with fime ronts divided into many delieate fibils, as luaths, which will searcely grow in stitl clay.
sume grous of finnts are almost entirely limited to peculiar situations, as the Alye and other smaller gromp of ofuntic plants. Some are exclusively tropical; others are only found in the colder parts of the world: and if any of the srompocur within the tropies, it is monntains of considerable elevation. Fint hesibes all this, and apart from all obvions differences of climate, soil. \&c, some itomp of phats, and these often contaning many spectes, are maly or chicdy found in certain parts of the worh. Thus the Conturow are cxclusively American ; whilst of the numerms species of Heath (Ericu), not ane is indigemons to America, althmogh many other jhants of the Jleath family (Ertera) are so. fonctines the plants which chingly abmad in one part of the wuld sem to be rephated by uther hat similar species, sumetines by those of another group in another 1 urt of the world, with simiar physieal characteristics. Thus Memmbremed and Crassulacerb sexm in sume countries to occupy the place of the American Cortarar. whilst the hack-iruited Crowberry (E'mputrum) if the northern parts of the world tinds a representative in a red-fraited species, extremely smilar, in the sonthern parts of couth America. Of many grups which ehietly helone to eertain climates or certain parts of the world, there ar- yet suecies which wander. as it were into very different cimates or remote parts of the womb; these speches luing often, however, manown where the other species of the gromp abound. Thas the common $l^{n-r i w n h b l e ~ i s ~ a ~ m o t h e r n ~ w a n d e r e r ~ o f ~ a ~}$ famly monly tropical. Some trang are common to parts of the worle wibly remote, and their prevalcmes is characteristic of these parts, as hotholodoulomes ant Meymolicece of North Ameruea and of the mometanous districts of the East limhes, although the Dmerican and the Asiatic species are not the same: Shate speci-s are believed to exist only within a very narrow range ; thers are very widely
difinsed. If fow are fams in the colder parts loth of the notherns and somthern hemiepheres, and abo on the intervening tronical muntans. Shme eromps
 towiar requous, as the impurtant (induntre to distrint of the Amin., and the ('alerolnatier to highere parts of the same manatain (hain.- Alrime veret:tim, like terrestrial vogetation, has shecins amd grans that are very grmerally diflused, and others confined to partiendar regions.
The seographical limits of spectes have no dombt been in many instances mantentionally moditiod by man, and the extent of this montification it is extremely difficult to ascertan. There is enome, however, in the known facts of botanical geography, evidently indepembent of such ageney, to athond fonmation for intorestins and important speculations, of which sone notice will be taken under the heml Species.

Nany of the prineipal facts of lotanical geocraply will be fomme stated in the artictes Jerorer, Asia, Amenica, ame Acratembia, and in articles on natural orders and gencrat of phants. Schomw and Meyen are among the chice authorities on this sulject: and the former has emberoured to diside the carth into :-5 botanical regions, chameterisent liy the prevalonee of partienlar forms of veqetation. The reader will find mach infomation on hatana geography, collected in a very aceessithe forn, in the Physical Atlas of Johnston and Berghaus.-Henfrey's 'Iegetation of Europe (Van Voorst, London, 1552) may be consulted with alloatage ; and the Cybrle Britamica, and Geogrophy af British Mlames, of Mr H. C. Watson, treating of the goomaphio distribution of plants in the liritish Isles, are morivalled among works of its kimd.
 write or describe) is, as its name implies, a description of the earth. This science is best considered under the three distinct heads of Mathemetical or Astronomical Geography, Physiral Geograhyy, aml Political (reograplyy, which all admit of further subdivision into manerous subsitiary hranehes.

Muthematical or Astronomical Guarraply descrihes the earth in its planctary relations as a member of the solar system, influencins and influenced 1 y other cosmical boties. It treats of the figure, masnitme, and density of the earth; its motion, and the laws hy which that motion is governed; therethen with the phenomena of the buwements of other cosmical berlies, on which depend the altornation of day and night, and of the seasons of the year, and the eelipses and occultations of the sum, mon, and planets; it determines position, and estimates distances on the earth's surface, and teaches methouls for the solution of astronomical problems, and the construction of the instruments necessary for swin oprations, together with the mondes of remesenting the smface of the earth by means of glokes, charts, and maps. The nmmerons subjects comprised in
 other parts of the pusent work, athe we therefore refer our readers for further partionlars to the several articles in which they are nome filly treated, as, for instance, Astionomi, Latituldi ind Loxaipuie,

Physural (Geography, as the mame indicates, consid rs the earth in its relation to nature and natural or physical haws omly. It descrines the earth, air, and water, and the orranisel heimes, whether anmal ur vegetable, ly which those elements are oecupith. and consmlers the histury, extent, mode, and cihnses of the distribution of these benms. 'Ihis may lee regarded as the most important branch of geegraph. ical seimee, since it involves the monsideration and stuily of $p^{\text {thenmena, wheb }}$ wat unly tend to further

024
the material intervets of mas. ly terehing him how Wost to gromote the develament of the jromets of nature, but also conduce in no inconsiderable learen to gemeral intellectnal adrane, ly stmulating the facultios of observation, and excreising the fowers of thought. The vast sphemo of inpitioy inchatem in physical gemerably netessarily eminame the eonsideration of all the natmal sciences generally, and wh ath hete, therefore, merely refor nim reaters for mone spectal information resterking the details of the sulpect to such articles as Cemanins, Jteat,

Political remoraphy has been well defned as 'inchating all these facts which are the immediate conscquences of the oprations of man, exercised either on the raw materials of the carth, or on the means of his interenurse with his follow-creatures.' Thus considered, it embaces, pimanily, the descrij)tion of the political or abhitrary divisions am limits of cmpixes kinerdums, and states; and, secondarily, that of the laws, moles of govermment, and social "ronisation which preval in the sereral coutries. IHe details of this maneh of geography will be fonnd umber the names of countries, cities, \&e., while more gencral information in regard to the subjert must be songht from historical, ${ }^{\text {whl }}$ itical, and statistical sources.

Before proceeding to sketch the progress and history of geographical discovery, we will indicate a fow of the lealing works that atford the best aid in studying the three main branches of geograply to which we have refomed. Thms, for instance, in Atathenatical Gengraphy, we wouk specially instance: Menual of Cemprephieal scipure (lart 1. Matho matical Cicomayhy, by Mr O'lisien); Herschel's outlines of Astronomy; Klocien's Erallunde (Iart 1.): in 1'hysical Geography, Ritter's Erelkmele; Kiouden's; A. Manry's La '́rim et llommo: Mrs Somerrille's Phusicul Genuraphy; Mr E. Maury's Mhysical Geogrephy of the sto \& \&e. : while in regard to Poli. tical Gengaphy, infurmation may he sounht from the great works uf Litter. Berghans, Stein, Waphins, anl Kloulen, ami from the ordinary geographical manuals and majs.

Giagraphicul. Miscorory-The earliest idea formed of the parth ley natima in a primeral condition secms to have leen that it was a flat circular dise, surmonded on all sides hy water, and covered by the laverns as with a canops, in the centre of which their own land was simposed to be situated. The Thericians were the first people who communicated to wher mations a koowledge of distant lands: and althengli little is known as to the exact period and extent of their various discoveries, they hant, lefore the age of IIomer, nawigated all parts of the Enxime. and fretrated beyme the limits of the Moditerranean into the Westem Gcean, and they thens form the dirst link of the areat chain uf discovery which, 200 years after them fommlation of the cities of l'artesins and Ctica, was carried by columhes to the mmote slores of Ameriea. liesides varions setthments nearer lome, these hed adventurers had foumded coloniss in Asia Minne alout Iroo rioc. and a centruy later they laid the fountation of Gowles, Utica, and sewmal othre rities, which was followed, in the comse of the gth e. ly that of Carthage from whence new streans of colonisation continued for several centuries to flnw to litherto mknown parts of the workh. The Phomicians, although less highly gifted than the Egyptians, rimk hext to them in rearid to the intuence which they cxerted on the procress of homan
 mechanies, their early use of weights and measures,
and what was of still creater importance, their emplorment of an alphalsetical form of writing, facilitatel amd confirmed emmucreial interomarse amons their own numerons colonics, and formed a bond of union which specdily embraced all the civilised nations of Nemitic and Nellonic origin. So rapin was the advance of gengraphical knowlelge between the are of the Homerie forms (which may be regaribel as representing the iblas entertainel at the commencement of the !the e. s.c.) and the time of Hesion (suOe.c.), that while in the former the earth is supposed to resemble a circular shich, surmmuled ly a rim of water, spoken of as the parent of all other streams, and the names of Asia and Earope appliad only, the former to the under valley of the Caister. and the latter to Grecee murth of lelopenmesus, 1 lision mentions parts of italy, Sicily, faul, and spain, ame is aequainted with the fieythians, and with the Dthiopians of Sonthern Africa. Dhrine the ith c. F.ו., certain Phmenicians, muler the patronare of Nikn or Necho Il. king of Egylt, madertork a vigace of diseovery, and are supposed to have ciremo navigated Africa. This expedition is recorted hy Herodotus, who relates that it enteren the sonthern Ocean ley way of the licel sea, and after three years' absence, returncl to Edypt liy the Pillars of Hereules. The finct of an actual circmmavigation of the African contiment has been Houlbted, liat the most convincing proof of its reality is attorded ly the observation which seemed incredille to Herolotus, viz, 'that the mariuces who sailel round Lillya (from east to west) hal the sun on their riaht band.' The 7th and lith ecuturics r.c. were momorable for the great alvance made in regard to the knowledge of the form and extent of the carth. Thales, and his pupil Auaximander, reputed to have been the first to draw maps, explodel many errors, and paved the way, by their observations, for the attainment of a sountler knowlelpe. 'I'he logographers contributed at this period to the same emb by the deseriptions which they gase of varions parts of the eartly; of these, perhajs the most interesting to us is the narrative of the c'arthariman 1 Iimileo, who discovered the British Islamls, wichalinr the Estrymuides, which be described as being a four mentlig' rogage from Tartessus.

With 1 ferodotus of IIalicarnassus (born 4St B.c.), whomay be regarded as the father of geography as well as of history, a new era began in regaril to geographical knowledge, for although his chicf ol,ject was to record the strmegles of the Grecks aul Persians, he las so minntely described the conntries which he visited in his extensive travels (which covered an area of more than $31^{\circ}$ or 1700 miles from tast to west, and $24^{\circ}$ or 1660 miles from north to south), that his II istory gives us a complete representation of all that was known of the earth's surface in his age. This knowlelge, which was extremely scanty, consisted in helievin!, that the worh was bounded to the sonth ly the Red sea or Indian Ocean, and to the west by the Atlantic, while its eastern hommaries, although adnutted to bee madefned, were conjecturel to be nearly identical with the limits of the Persian copire, and its northern termination somewhere ins the region of the amberfands of the lialtic, which has been visited by I'henician mariners, and with which the pople of Massilia (the modern Marscille) kept up constant interconrse by way of Gaul and Gcrmany: In the next century, the aclievements of Alexander the Great tended materially to enlarge the bounls of haman knowledge, for while lie carried his arms to the banks of the Imdus and Oxus, and extended his conquests to Northern and Eastern Asia, he at the same time promoted science, by sending expeditions
to exphere and survey the varinus prorinces which be suldined, and to make collections of all that was curnus in rogar] to the organic and inorganic [mo ducts of the newly visited districts; and bence the victuries of the Macemonian conqueror formed a m w era in physical inguiry generally, as well as in gengraphical distovery specially. While Alexander Was opming the East to the knowledge of western nations, l'y thens, an adrenturoms nawiator of Maseilia, combueted an expedition past spain and (iand through the Chanel, romel the east of Enyland into the Nowthern Ouean, where, after six days' sailing, he reached Thule (emjuctured to be lceland), aud returning, passert inte the budte', where he heard of the Terutones aml (Guths. Discuvery was thas beimer extemded both in the nothand eart intorecrions whost very existence harl never been suspected, or which hal litherto been regarled as mere chaotic wastes. An important akvance in seography was made ly Eratosthenes (hurn 2.6 b, $\%$ ) whotirst used parablels of longitule and latitule, and construeted maps on nathematical priuciples. Although bis work on gendraphy is host, we lean from strabo that he considerel the world tu le a sphare revolving witl its surroundine atmoghere on one and the same axis, and having one centre. Ife helicen! that only abont we-eighth of the earth's surfice was inhal.: ited, while the extreme $p^{\prime \prime}$ ints of his habitable world were Thule in the morth, (hina in the east, the Cinmamm Coact of Africa in the sonth, and the Irom. Sacrum (Cape st Vincent) in the west. Durine the interval between the ares of Eratosthenes and Strabo (born G6 i. c.), many voluminous works on geography were compilen, whils have been either wholly lost to na, or only sery partially peservel in the records of later writers. Ntraln's great work on georrajhy, which is said to have been composed when he was eighty years of age, has been considered as a molel of what such works should be in regrird to the methods of treatim, the suliject: Iat while his lescriptions of all the places he has himsolf visited are interestingome instructive, he seems nonluly to have discarded the anthority of peceding writers.

The wars and conquests of the liomans had a most important bearinis upon geography, since the practiond genius of the lioman leople led them to the study of the material resomeces of crery province and state bronglit under their sway, and the greatest service was done to gengraphical knowledge by the surrey of the empire, which was begun ly Julins Casar, and completes hy Augustus. This work couprised a description and measurement of every morince lay the most celdmated geometricians of the day. Pliny (born 28 A .13 ), whon hat travelled in Spain, Gaul, Germany, aud Africa, las left us a compendium of the geographical and physical science of his age in the fomir lwoks of his Mistorit Futuralis which he devotes to the sanject. IIe collected with inderatimabe indmatry the information contained in the works of Nallust, Ciesar. Tacitus, and others, to which he ahlled the results of his own oliservations, without, boweycr, diseriminating letween fact and fiction. The prugress that hail been made since Casar's time in gengraphical knowlellge is erinced hy Pliny's notice of arctic regions ant of the Scamlinavian lauds, and the accounts which be gives of Mount -Itlas, the eouse of the Nimer, and cif varinus settlements in different parts of Africa; while his knowledre of Asia is more correct than that of his predecessors, for he correctly affirms that Ceylon is an islind, and wot the commencement of a new continent, as had lreen generally supposed. The study of geography in ancient times may be said to have terminated with C. I'tolemy, who tlourished in the middle of the $2 d \mathrm{c}$. of our era. His work

## GEOGRAP1IY.

on Generaphy, in einht hooks, which continned to be regarded as the bust ferfere system of the seremee throunh the datk and midnle niges alown to the l6th e., gives a tolarably eonreet accoment of tha wellknown comatries of the worlal, and of the Maliter. ran an, Limxime amd laspian, tomether with the rivors which fall into those seite, hat it abled little to the knowledut of the north of Eurome or the extrome lunambiles of dsia or dinez let, from his time till the $1+t_{1}$ c., when the reconds of the travels of the Velletian Nared lebos pheved new fiehls of inguiry, the statemonts of l'talemy were never questinatl, and even derine the lothe es was only amony a fow Gemman selbolars at Xirmberig that the strange accounts given of distant eastann lands ly the Vimetian travellep were reaved as turtwortly where he ditered from Itolemy: Mareo Polo Lad, huweres', mofortunately made no astronomical observations, nor had lie evin recorded the lenerth of the day at any plater, and hence the Niunlerg gengraphers, who hat no cortain data for ustinating the extent of the conntries which he had traversed, were the means of projagating eroors which led to results that were destincil to influence the history of mankind: for takinu I'tolemy's tables as their basis, they had incmporaterk on their erlohes and maps the results of their own rough estimates of the length of Maren Poln's diys' joumeys, and they had thes represented the contiment of $A$ sia as extending across the l'acific, and havine its eastern shores somewhere in the resion of the Antilles. These ermmeons catenlations mislud christopher ('olumbus to the falso assumption that, ly sailing 120 west, le womd reach the wealthy trading marts of Clina, aml the result of this convietion was his contering upur that momomale viperlition which terminated in tle discovery (in $141^{\prime \prime}$ ) of the continent of America. Although there can be nu donlet that the Amerienn motinent wink visited in the ath and luth e. by Northmen, the erent remainel without inflnence on the history if lisenvery, aml cinnot thereme aletrat from the dams of ('mbmbus. 'Jhis mommentons disenvery. Whicle hand breeu preeded in ldobly the explomatim of the African coast as fir as the Cape of fromi Ilope (which was dombleal les Vasen da trama in 14!7), was followed by a mpid sucession of disewseries: and within 30 yours uf the date of the lirst voyage of Commons, the whole const of Americalfom incomlamd to ("aje Ilom have
 and the worlal circumariquted by Nagellan (I. v.) the coasta uf Eastern Dirion, Dralna. l'ersia, and India haud lren risited lyy the l'orturnese, and manerous islamls in the hinian Oeran discovered. The lith e', was marker] ly erontinned attompts, successful and unsuccessful, to extend the sphere of occmid discovery; and the desire to reach Indial ly a shanter route than those ly tha Cape of liond Hope ur ('ape llom, led to many attempets to dis. conra a math-west presag, which, thongh they sicmally fallal in their whject, land the affect of very materially enlarering our knowletue of the aretic regions. The expertitions of Willomans and rioo-
 (164), and Batlin (bilif), were the most mportant in their results towards thas end. The loth and 1Sth enturies wase a new thm to the study of
 it, which, in their timn, derived elacidation from the extensinn of georrapheal knowlellec; and it is to the aid durived from history, astronomy, and the Ihysioal and naturad sciences. that we owe the completeness which has characterisul modern works
 Tasman and Van Dicurn, mbelu the fustralasian
islamds known to tlace civilised world ; and in the latter balf of the 3 sth c., ('aptain Cook extemded the preat wetanc explorations by the liscovery of New Kendand amd many of the I'olyonsian gronps ; but he fatided to find tho antaretic eontinent. Which was firot vesited in 1810 ly Amerinan, Fuglish, and lounch oxpeditions, undir theid respective commammers, Wilkes, Ross, ami lommont d'Corville. This will fuobably frove to lave luen amoner the lant of great aceanic riscovaies; and the attention of "xjhorers is now tmrned to the interior of the ervat continents. In imerica, the travels of Inmaboldt, dewis and Clark, Fremont, and others, have done moli to make us acinaintal with lroad general featmes, but much remains to be done in regard to special districts of C'entral and sunthern America In Asia, numerons travellers. reotraphers, and maturalists have contributed to rumer war knowledige precise and certan in respert to a grat part of the continent, whose natural characteristies lave heen more especially represented liy the ereat physicist Kitter; while we owe a larae ilelet of gratitude to the Jesuit missionaries, whase imdefatigable zeal has furmished us with a rich mass of information in regard to minor dutails of Asiatic life and nature. In Afrien, the combined influences of a deleterious climate, and a religion hostile to Ewopan adramee, have hitherto retirded explorations into the interior; but notwithstambing these abstacles, much light has heen thrown on the character and condition of the African eontinent by many of its Ereatest explorers-as Brace, Park, Clapperton, Alansm, the Lambers, Burtin, Sblie. Barth, Vogel, ann Livinestone. In Anstralia, althongh much still remans to be done, the obscurity which had hitherto lang oscr the interior has heen to a ureat extent eliminished by the explomations of Niturt, Eyre, Lelehharit, and the bothers Grequry ; and still more ly the lifgly important labours of Thake and Vílls, wha in lsuo erossed the dustralian continent from Meboume to Carjentaria. Athonerh luth these intrepid explovers arrished misemaly from staruation wn their retmon ronte, their jumbials and the descrintion that has been given liy then and theib sote-sarviving companion, King, of the conutry thromith which they lassen frose that the lond is far from being the desent it was ance imarined to the.

The progress which has marked reeent diseovery has lean moterially aided by the encomragement and systematie organisation which lave been giben to Jhans of exploration by the publie goveruments of different countries, and lis the efforts of the numerons gengrabhical societios which have heen fommed durmis the pesent ceutury both at home and alnowl; while the constantly increasing mass of infomation collected by scientitic explorers is rapidly diftusing correet information in regral to Histant regions, and thas eflectually dispelliner the mumerous fallacies which have litherto obsenved the science of grograhy. Anong the mumerous works of authority on the subject of ereomathical dis. covery, the following may le consulted with alyantage "lludson"s Eumprobit cireri minores ; Prícis de Geourophis IVierratle, by Malte Bran; Mamual of loontophical Scenee (mathematien, physieal, historical, and descriptive), lsbo ; Latham's Cemania of 'Lacitus; Mumluldt's Mist. crit. ale l'Mint. de la Goofraphat, Asie ('ratrahe, and the Cosmos; Ritter's Asien: imbl Die Ejolkumbe in Vrohallnisw z, Natur. u. 1. C'rach. 1l. Menorhheit; I'uterunann, Mitheilungen aus. J. Pe rthes' ratprethiseher 1 Install (1855-I857); l'rocemengs of cieamuphical Socity, \&e.

## GiEOLOGX.

The dotermination of the order of the strata, and the Erompine of them in chromblusial order, were
 (17ai), Joallas (175), and Wromes. Smith made the most innortant contrilntion to this subject when, in 170n, he published his Tubulur Vime of the Frition stater. He shewed their superpsition, and characterised the datferent gromp by the ir peculiar fossils. The publication of his deongical Map of Englam (181.0) may bee sail to form an chech in the history of eroblong: Since then, the science has advanceil ly raphe strides: amd it is not ton moli to expect that cre lons all the chief geological features of the accessible parts of the world will be known and 1 mblished.
Geolory, in its restricted and usual sense, takes equmizance of the solid substance of the earth, or rather of as much of it as is accessible to man's olservation. Whe has not, 1 y his own eflorts, penetrated at any point more than a few humdred yards from the surface : but natural sections, and the peenliar arrangmont of the stratitied rocks (the key to which he has to some extent altained), have given him an acquaintance with a greater thickness than could have resulted from his own laburs. He has thas lis actual observations, coupled with reasonings upon them, hecn alle to construct an jdeal section representing a depth of perhaps ten miles, or about or footh part of the distance from the surface to the centre. He does not, and camme with eertainty, know auything of the structure or condition of what is decper. This does not, however, 1 revent the attempt to know something of what is beyond; and in making the attempt, there are many facts which serve as bases fur inductions, or at least theorisings, as to the condition of the interior of the globe. As the conchsions depend upm the lalaneing of evilence, upon the value given to one set of facts as set against another, they will differ acemding to the montance wiven by each individual to the one or nther set of facts.
The lone eutertained opinion of the existence of a central heat seems to lie on the whle fairly estanlishes, and upon such facts as these: 1 . There is a regular and gradual increase in the temperature of all deep maines, egual to $1^{\circ} \mathrm{F}$. for every 5 a feet of rescent after the first 100.2 . Heep wolls lave always a high temperature. This has been earefully chetermined in artesian wells, not only hy apphying the thermometer to the water at the surface whieh has risen from a known deph, lut also by sinking the instrment to varions depths. The results have shewn an increment similar to that exhinited in mincs. Ifot or boiling natural springs rise through great and deep fissures. 3. Igneons rocks-that is to say rocks which have conled from a state of fusion ty heat-invariably come from below upwards, and thas testify to an anome of interual heat able either to retain these rocks in a state of fusion, or to convert them into a thaid combition befone their ejection. 4. Physies also emontrilutes inportant evidence. The specitic gravity of granite or hasalt is scarcely : $?$, whlle that of the earth, acenting to the recent expmoments of Airy, is almut $\mathrm{B}_{\mathrm{I}}$. If the earth were salid, the inthence of gravitation would so increase the density of the composing rock as to give a greater speritic gravity for the earth than 61 . There mast, then, be some expansive force actine to realue the gravity, and the only foree with which we are acminainted that conld sir aet is leat. On the wher hand, physies raises difheulties wheh malitate aganst the fluid condition of any considerahberenthe of the carth's interior, and in these dillicultics it is supported hy astrommy. If, howrowe tha olservations madi in mines and wells surply a meanare for estimating the increase from
the surface downwards of that hoat whieh secms to be fairly estallished, then it wond follow that the solid crust of the earth is not more than $2 . a$ miles
 as to fuse any known sulistance.

The strict prowince of groldy is the olserved or observalle portion of the carth's crust. The early geolugists were no mom than geognoststhey olserved and deseribed the rock-mineralogy of ilistricts, and thens laid the foundations for those generalisations which have raised geology to its present position. The materials of the aith's crust were at first grouped turether according to their composition, structure, and orimin; but gradually it hecame evident that the rocks themsclves oceurred in gromps, and that they had a particular order in natme: matil at last, all the sedimentary strata were arranged in a single contimuous and chronological series, from characters drawn less from their lithological strncture than from their organic contents. Both systems of elassification are important-that of the geognost a.s well ass that of the modem geologist. The one is the result, to a large extent, of work in the laboratory and the study, and may be aceomplished by the examination of hand specimens; the other must be determined in the ficle, and only from the examination of rocks in the mass, and in their natural position. The term bithology has leen applied to the one aspect, while stromatology (stroma, a layer) may with equal fitness be given to the other.

Lithology--All rocks are either igneous or sedimentary; that is, have either been produced by the action of heat, or been arrangel by mechanical or other means in layers or heds.
I. The Igneous rocks differ amongst themselves in their comprsition, structure, and age: they are made up of different materials; they have various textures, as grannlar, compact, or glassy; and they have been ejpeted at lifferent periods of the earth's history. From these characteristies, they have been gromperl thus: 1. The Voleanie Tocks ( 1 . W.), comprisins all that have been formed during the present and tertiary periods, and which aro popularly known as laras and volcanie ash. They have been ejucted from volcanoes either in a flud state, spreading over the laml, and cooling as compact lavas: or spreading bolow shallow water, and becoming vesicular pmonice, or as ash seattered in layers over the country; or they bave risen into cracks and crevices of rocks as dykes and veins. Their primeipal constituents are felspar and augite, and the different varieties depend on the predominance of the une or other of these ingredients. The foldspathic lavas are generally light-coloured, and have a rongl prickly feel to the linger. The chid varietics are I'rachyte, Pearlstone, Phonohte. Obsidian, and l'umice. The augitic lavas are of a dark-green or black colour, weathering brown externally, and are generally heavier than the feldspathic livas. The most common forms are Dolorite, Ihasalt, and Leucite. -. The Trappean Rocks (q.v.), which gencrally belong to the primary and secondary strata, and are composed of the same materials as the volcanc rocks, execpt that the silicates of magnesia and lime crystallise in the latter as angite, while they assume the more ohtuse form of homblenle in the trapluean rocks. Trap-rocks aro always associated with a pile or dyke connecting them with the miderlying mass from which the materials were obtainct, They lave either overHown the surface, and formed a bed conformahle to, ant contemporaneons with the subjacent strata, or inserted thenselves lexween already formed strata, formine injected sheets that are nut contemporancous. The predominance of the one coustituent
material over the other tives the hasis for armumy the trappean rocks into, the feldspatlic trap, which are light-entumed aml sencrally compact rows, the chicf virictices licing Filltune and l'itchastone, and Hornhbulic traps in Cirenstones, containing the most almudant and best lanown rucks of this division. They are of a greeninl colour, varying from very light, when the flespres is white and aboundins, to almont liack, when the constituent minerals are finely dividel and colnared with irm, ln texture, also, there is consideralde ditference, sume hiag fincerraincul and compact, while in others the erystalline strncture is sery evilent. The principal varicties are Greenstunc, Basalt, ami Melaphyre. Porplyyry occurs in both the voleanic and traptean rocks when the felspar is ageregatel in harge and evident crystals, seattered thrmegh the holy of the rock. : The Cranitie liocks (q. $\begin{gathered}\text { w.). The strikin! }\end{gathered}$ characteristic of these rocks is the ahmulance of silex in a separate amb nacomininel state as pure quartz. Gramites are associated with the primary strata: they furm alsin the sulport of the selimechtary deposit, wherever their hase has hewn expweal to view. They nerne in bels owerspreating the sedimentary depusits or intercalatell with fhem. in dykes, or as the aprnent fundmental anil unstratifies rock. The chici varictics are truc Granite Syenite, and Protargne.
11. The Selimentary hochs necur in layers or strata. They are cither ayneons, aierial, chemical, or organic in their urigin. 1 . The Agneme liocks (q. v.) are Ar illaceous (q. v.), composel more ne less of clay; as kadin shale and clay-slate; or Arenaceons ( $\mathrm{f} . \mathrm{v}$.$) ) in which the constitucrit purtions are so large$ as to be evident to the eye, as in samblatone. The aquenns rocks were depesitel in thin layers, which, however, frecpently chhere, so as to form sulid masses or beds of considerable thickness. Originally depositel horizontally, they have in many cases been subjected to disturlanices that have devated or depressed them; hence have arisen Faults (?. v.) and Dislocations (q, w.), as well as the exposiug of the elges of the strata on the surfice of the carth (Strike, of r.) at rarious angles (Dip, 4.5 .). . . The Aerial lucks, which caunt be casily sepraraten from agueous rocks, except ly their anomalous stratification (se. Dmet). They phay so important a part on sauly coasts and arill interiors at the present day, that it cannot be doultel that they h. pled in former periuds to lring the earth intur its present condition. 3. The Chemieal liocks have bren formed from the exaporation of liquids containing sulbstances in sulution. The materials thens depasited are salt, wysum, lime, and silex. Salt is geverally associated with gypsun, and occurs in a areat range of formations from the Devonian or Carbmiferons, up to the most recent. The salt mines at Northwich, in Cheshire, lelong to the Triassic periol. Fock-salt occurs in a conrsely crystalline mass, geverally coloured with irm, and more or hess nixed with elay and other impuritios. The eleposits are often of geat thickness, bat apparently of limited extent, aul were probably precipitatel in isulated lrine-lakes. dyproun seems to bave been formed under similar circumstanees, It is abuadint in the Magnesian limestune, in the Lombu Clay, and in the laris Basin. limue has not bendepositel in masses, like cy?sum, but only from the exposire to the atmosphere of small quantities of liquid saturated with it, which, by evaloration, have left stalaynitic or tufaceons deposits. Silicions sinter has been deposited in a similar manner as it is at 4. The Organic liocks are those which have been entirely, or t a large extent, formal from the enaius of aniunals-as chanls and other more
compact limestmes-or vactabies, as coal, lignite, ime diathnaceons depusits.
Chames are contimadly taking phee in the sedimontary rocks, altering their structure and texture. Anvos the chief agenta inchnting thes metamorphic chamecs are chmical attraction, the infliltation of water. the pressure of the sunvincumbent stration aud alowe all, hat and magnetisun. Sonse of the Wher strata have heen somplatherell that they are gencrally spoken of as Metammphis Sooks (1. s.).
Stronatohoy-- We alply this title to that clivision if gedney whin considers the stratified rocks in their chroubugieal inder. as oxhinting different phases of the lintory amd devehment of the gloho itself, amb in their insill contents settin! forth tho progress of hife mon its surface, Jickerring th the
 vegetable organisms, that have loce precred in the rocks, we shell lece cive a rapid sketch of the varims perimes in the carth's gethgical history.

The onjinal, and, as it is surposed, molten condition of the uldele is him in mystery ind mecrtanty. The genlogist takes ur the history at the jwint where air and water make their apmanane, and where the inureanic snlstances were sulject to the sanc influcnces as thase now in operation. It is very huabtul whe ther the fundancutal crust is in any phace exposed or has ever twen meaveral ly man. The earlicst rocks cherevel, though pobaily not the oldest, are those deacriveel ley Lenga as the Leturentian sistem (1. . . ). The typical beds weeur in Canada; strata of the same are have lately been detecterl in sothan by Murchison and Grikie. The strata have then very much metanorphusel ly the action of heat, amd ly the many chemical and physical furces which hat has set in motion, so that the orisinal conditima is cutirely altered, the whule serics being convertal into gneissose strata, with one or two greatly altered beds in lime. stone. Fossils, if they ever existed, have leen nibliterated. Even in the suceecting Combriun Series (11. v.), they are very rare, consisting of a few 2,xiphytes. crnatacemis, and amolills, with very doubtinl impressuns of sea-weets. The racks of this period consist of thick masses of sanlatones and shates or shalls. The siluriun Period (q. y.) is represented ly inumense marine elepsits, which in some listricts are rich in the remains of invertelnate ammals, while other extensive tracts hase not yichted a single fussil. No. critain evilunce of ilants las yet been observel in this perion, yet the economy of life wolld however renmire then as now, oxysen-prolncers and eathonic acid consunmers. P'rhap the anthracite of the graptulitic shilles, and the od from the bituminsus silurian shates of Surth America, may be in part or in whole of veretalle origin. The first traces of the existence of dry land occur in the Old Ia.d Sendstome (!. v.). The great mass of the strata of this perion emosist of inmense thicknesses of limestone, composed uf corids and sleel-finh, of beds of shate and of samestone, crowdel in some phaces with tish-remains. A fow land-plants and air-breathing aminals, the temants of the dry land, are preservel in the mper stratia, which, huwever. probally lelhng to the next primi. The Curbmiferous Metusurs (ste CamosiFentes Sysmem are ushered in hy a great thichness of deep-sea linestone. The coal-pearin! strata are alternately sea, estuary, or lake depasits of samelstone, shale, and limestone, and dry land surfaces with the vegetation converted into coal. The waters teemed with fishes of great size and strange iom ; and the dry land was coverel with a mank and luxuriant regetation of ferns and conifurns trees, and strance forms like gigantie reeds and club-nosses. A fuw air-breathing reptiles and shells have beeu

fror a lome perionl after the time of Arebimedes, we final few manmes of note in conmection with sumbetry. We but mention Nicomerles, llidnarchus, aine Theodusins of Tripoli. The Greeks, fowever, never motermitted their attention to the science; they contimued it eren after thein sobjuration ly the liamans, and wo fiml them producing many excellent geometers after the tramslation of
the loman brmpere and within our era: lowdemy

 whas lial in the sth. and Enterius, in the dith centurs. The works of all these writers are still extant. Meautime the limmans, the flmmant race, even in the most flomrishing time of the repmblic, were so innorant of the scifnee, that, accordme to Tacitns: they save the name of Mathematicians ( (I. $\begin{aligned} \text {.) }\end{aligned}$ to thuse who fratised divination amd judicial astrulugy. As may be smpusel, their domination was mot farouralile to the seltence, and only one lioman name can be mentumen-viz, Boethins. who livall towaris the close of the oth e., who attained cminerne in geotactry; and of his writines. it must le sairl, as of the loman literature gencrally, that they were but emapilations and reflections of dreels thought. Int if the lioman empire was mfavourable, its downfall. and the consequent inundation of ighnance and hirharism, were still more so. The rise of the Mohammedan luwer in the 7 th c ., and the raphat and desolating consequences which followed, further hastene the extinction of the Greek sciences. The time now came when those who devoted thenselves to science were everywhere lranded as magicians, and exposed to popmar fury. It was in these times that, fortumately for civilisation, an asylum was fornd for the spurit of inquiry in Arabia. An acquaintauce with the science of the 1Limins prepared the Arabians for the reception of the writing of the Greck astronmers amb mathematicians: and the dispersion of the scientife coteries of Alexamhia cepiturs in the leming if the West. In littie more than a eentury after it tords 1 lace, the Araluians were the most zealous patrons and eultivaturs of Greck science; from the 9th to the 14 th ceuturies, they produced many astroumers, wemetricians, \&e.; aurl throngh them the mathematical sciences were again restored to Europe towards the close of the 14 th c ., heing tirst receired in Spain and ltaly: The revival of ancient literature in Europe, ant the discovery of the art of printing about the middle of the luth c., concurred to diffuse a knowledie of the science of the (irecks, which came into notice with their general literatne; and from this date, many names oceur of cwinent geometricians. Durine tho lbth c., Enchil was leld in sueh estimation, that no antempts were male to anlwance the science beyomd the point at which he lett it. Commentaries amt trauslations of the Blements of Luclill were rife; hat till the time if Kepler, no attempts were made to inumore or extend the metheds of genmetry. kepler ( g . r ) intruntued the principle of infinity inturemuctry. Next, Descantes, scizing the results of Vieta's discoweries in the nse of symmols, inventel the new or the analytical alychraical geonetry, which vastly extembed the domains of the science. It then requirel but the invention of the calculns to give the scicnce that grand sweep ant phere which it now possesses. For a nutice of some if the more recent improvements in temotrical
 The readir will also find a rery excellent riew of The growth of the science in the intrinluction to Dr Putt's Eiuclid (1,ondon, 1545); also under the barions names of those mentiond in this article, will he fonded fuller motices of their contribntims to the science. Globlice I., ling of Great Pritain, son of Emist August, Elector of 1 limover, and of Suphia, a gramblanghtor of James 1 . of ligghat, was hurn on enth May l660. Accorling to the theny that the hood of Jants 11 . in the tliecet line was 'cormpect,' he was the nearest heir to the crown. On the lenth of Guecn Anm, Shst July 171\%, he was instantly proclaincel king, aml arrived in this comoty from his tlectorate of Hanover at the arge of 54. To him this comutry was to the last a foreign country, for which he had no love, and of the langlarte, feelings, and thought of which, he was proteundly imorant. Ilis aflections remaned with llanever, liout to Irritain bis alliances, experience, and fair aliditius for business, resulately exereised, were of considerable value. A kimy of more lobliant parts minht have been an impediment in the way of constititional government aljusting itscli to habits of domestic peace aul orler after the dethronement of the Stuarts, whose ruiucl fortunes cxcited the pity of the people, aud atiorthel a convenient cry for the minority, that declaninch in private, anil wrote songs, and jlotted against the imported king, whom they called a - Fureign tyrant. Jeing supportal ly the Whigs, and malisguisedly $\mathrm{p}^{\text {artial }}$ to them. the Tories were adverse tio him, as well as the Jacohites, and they associated togethor tolning about a revolution. In Scotlame, in 1715, the Earl of Mar raised the standard of rebellion; and he had collected about 10.000 men, when he encagel the Duke of Argyle with abont half that munher of men at sherifimuir, near Dumbane. It was a hrawn battle, the leit wing of both armies locing victorions; lut to the rebels it was not a victory and it causel delay and checked their prowress, and that was equivalent to a defent, for the Jlichlanders, seeing little prospeet of tighting and phumer, returned home; ant in that part of the island the relellion may be said to have burmed out of itself. In England, it chad not sneced so well; and it was enden miserably ly the unconditional surrender of the insurgents at Preston. lor this mutbrak the Earl of Derwentwater and Viseoment kemme were beheaded on Tower Hill. overal otheers were shot, many persons of distimetion wore attainted, alont thinty of the less conspixhous rehels were executed, and above 1000 were tramprontel to the plantations. The Earl of Mar anul the l'retember lath escaped to Frauce.

The next must notable aml calamitons event of this reign was the failure of the sonth sea Company (1. (.). A quarrel with the spmiards emmenced in $1-0$, , which issued in a somewhat nnsucuessful expertition of Ammiral Hosier to their Ameriean possessions, and a fruitless attempt on Gibraltar ( $\mathrm{q}, \mathrm{x}$ ) liy the Spaniarls. In 1727. George 1., who had, amiel the splendours of Jhitisly royalty, sighed for his fatherland and his family, set out for Hanover, and died of applexy on his way to visit his lrother, who was Bishop of Osnalorys, on the night of the loth or the morning of the llth of June. Ilis life was mot a happy one. His wife, Sulnia Dorother of Kell, to whom he was untrue, had solaced berself hy yidling to the attentions if 1 hilip ron kuningsmark. On Sunday the 1st Jnly 1604 the latter elisappearel for ever in a mysterinus way, and on the estly becember Soldia was divorcel. The remaining : $: 2$ years of her life were spent as a misoner in the fortiess of Ahlden. where she died at the age of 60 . There are clear Hhmpes of Geore 1 , in Carlyle's Life of Frederick the firmet. Carlyle comments his talent for silence, and thinks him, in spite of aplcarances, a man of

'l'lao lecremd of his emallict with the Dration anose mont
 tation of his contest with the pawan permecutur. As
 lee was early rosimiled as one of the patrons of the military protession. C'mber this title, he was honomrel in France as early as the bith c. : lant it was not until aiter the Crusalers, who ascribed their sucenss at the sione of Antineh to his intercession, retmmed to Eurence from the IInly WVar, that the relinions honemr mail to him leached its full develupment. ILe was selected as the patron saint ut the Licqualie of Genon ansl also of Eingland. It the coumeil of Oxford, in $1 \because \sim 2$, his feast was ordered to be ketut as a national festival. In linin, le wis made the patron of the Order of the dartur lyy Edward III: and cven since the feformation, the ancient sentiment is still $\mathrm{p}^{\text {opularly }}$ maintaincal.
(:EORGE, ST, BANXER Of, white with a red cross. According to Sir N. II. Nicolas, the cross of st George was worn as a batige over the armour by every English soldier ' in the I Itli amd subseruent ecnturies, cem if the custom din not luevail at a mach earlier period,' to indicate that he was in the sorvice of the crown. On the invasion of Sootlanel by Tivehard I1. in 1356, it was whained? '1hat everi man of what estate, eondicion, or netion they be of, so that Le be of owe partie, bere a sigut of the armes of Sixint George, large, bothe before and bohymile, urn parell that yf he he slayne or womeled to deth, lae that hath so doon to hym shall not lie putte to deth for defalte of the crosse that he lacketh. Anul that non enemy do here the same taktan or crosse of St George, notwithstandyug if be be prisomer, mon payne of deth.' A similar ordinance was arlopted by llenry $V$. fol the govermment of his army in Framee.

GDODR(iE, "Tire, the lodge of the Oriter of tho Garter (q.. ) , exhibiting the figure of St George on horstback piercing the falling dragon, which lies on a mownt.
(GEOLCEES CIIANNEL, ST, is the name aplied to the sunth portion of that arm of the Atlantic which separates Ireland from the United Kingdon. A line, cxtending from Hulyhead in Wales to Dublin, would form the northern limit of this channel; and a similar line from St lywid's Head to Wrexfore, would form its southern limit. At its northern extremity it is 64 miles in width, and at its southern it is about 62 miles wide; its lenerth, from north-east to south-west, is about 100 miles.

GEOLGETOWN, a eity anl port of entry of North America, in the state of Maryland, is situated
on a range of lills, the highest of which are demominated tha Heaghts, on the left lank of the l'utomac, two miles north-west of Washington (fl. v.). Fom the lhights, which are occupied hy elegant villas, a mannificent view of the cities of $\mathrm{g}_{\mathrm{x}}$. Wrashingthan, inul of the surfouding eountry is ontainel. A. is quict and antipuated. ame has a reputation for its literary alvantuges and for its refined society. Its principal institutions are the Ceorgetown colle ere, under the manarement of the Jesujts, and the convent of Visitatom Nuns-attached to which is :un acalemy for females with ahout 100 pupils. Here the Alexandria branch of the chesapeake and Ohio Gimal is carried across the Potomac ly means uf :n chormous viaduct 1440 fect long, and 36 feet above the ordinary level of the water. As it is the "nly lent in the district of Columbia, and situated at the lical of the narigation of the Potomac, 125 miles from its mouth, its foreign commerce and coastines trade are important. It keds at mills in opration to surply its trale in flowr. It is no of the greatest markets in the United States for shad and herrings, of which vast quantities are eanght in the l'otomac, and brought here for larrelling. Pol' (1870) $11,384$.

GEORGETOWN (Dutch, Slalroch), the capital of Sritish Gniana, is sitnatel at the month, and on the right or eastern slone, of the river ] Mmerara, in lat. $6^{\circ} 49^{\prime}-0^{\prime \prime} \mathrm{N}$., and long. $5 S^{\circ} 11^{\prime}$ :U' W. It is handsomely huilt, and consists of spacious, clan streets, intersecting at right augles, and composed of neat wooden bouses, which are raised three or four feet above the ground, in orter to aroid the damp, Lare open verandihs in front, and are embosomed in trees, of which the cablugepalm, the cocoa-but, and the orange tree are the chief. Most of the streets are traversed by canals, communicating with each other and with the river. Of the public buildinys, the town-hall, an elegme strncture, with marhle-paved galleries resting on cast-iron colmmas, the Episcopal catherm, and the Commial Hospital, are the principal. There are also a mariners' hospital, numerous churehes and schools, astronomical and botanical societics, harmacks, theatres, and a market-phace surronded hy elerant and well-stocked shops. (i,., owing to the low and swampy character of the histrict in which it stands, is unhealthy. Yellow and intermittent fevers. diarrhua, dysentery, and dreisy are local diseases. The chicf exports of Cr, are sugar, coflee, :und rum ; and its annual trade employs about goo vassels of lus,000 tons burden. I'pulation eb,000, of which about 20,000 are negroes and preple of coltur:

GROMGIA, GUlf of, an arm of the North Tasilic Ocean, between Vancouver's Island and the mainkand of Pritish Columbia. It averages 20 miles in wilth, is 100 miles in length, reccives Praser liter (4. v.), and communicates with the open ocean liy Queen Charlatte's Sound in the north, and loy the Sitrait of Fuea in the south. Its somtherly entrance is ahout lat. $40^{\circ} \mathrm{N}$. and long. $121^{\circ} \mathrm{W}$ 。

GLEORGIA, an Atlantic state of the American Union, and whe of the 13 original states, extends in lat. from $30^{\prime} 21^{\prime}$ to $\$ 5^{\circ} \mathrm{N}$., and in long. from $80^{\circ} 45^{\prime}$ to $85^{\circ} 40^{\prime} \mathrm{W}$. It is bonnded on the N. and N.E. by the states of Temessee, North Carolina, and south Garolina, on the W. by Alabma, and on the S. by Flowila. Its extreme length, from north to sonth, is 320 miles; aml its greatest hrealth, from east to west, is 954 miles. Its area is 55,000 square miles; anl its pupulation in 1870 was $1,181,109$. The proportions of races were-whites, 63s,920; $\begin{gathered}\text { eoloneen, } \\ 70 ;\end{gathered}, 545,143$; Chinese, 1 . The abolition of
slavery is forcildy representel in these statistics. In 1860 , the agigregate value of the lam was $\$ 7,117,616$ dollars; the value of town ant city mojerty, $35.473,905$; and that of property of all kinds in the state was estimater at $207,963,696$ dollars. (8. was then represented in the foderal congress ly $s$ members and 2 senators. (i, presents pery varinty of surface, rising from low alluzal lands ant swamps along the shore through an molulating and rough hilly conatry to the lblue Iidue Momtains, in the north and north-west of the state. The chief rivers are the Sawanah, which forms the north-east homdary of the state, and the Chattahoochee, which forms a great portion of its sonth-west boundary. The course of all tho inportant rivers is toward the sonth and sontheast. Only about a fiith of the entire area of the state is under cultivation; hut owing to the diversity of climate and soil, the productions are wonderful in their variety. The islands that fringe the coast are fertile in cotton of a superior quality: the bottom lands of the great rivers ${ }^{\text {noduce }}$ rice, cotton, Indian cors, and sugar ; further west are the 'pine harrens,' valuable for their timber, and easily cultivable; the central region consists of a lnamy soil, once productive, but now impoverished; and the north, the Cherokee comntry, contains lands which, although long worked by the Indians, still produce from 50 to 76 bushels of grain to the acre. Guld, though not now sought for, was once found lere in some quantity; silver, copper, iron, lead, marble, and precions stones also oceur. (x. has nymards of 1600 miles of railway; is dividet into $1: 2$ counties-the capital being Milledgeville. It was colonised in 1733. Having joincl in the great revolt which necasioned the American war, and shared the defeat, it was readmitted into the Union in $18 \% 0$. There are in the state 3.3 , collectes, with an average of 3300 students; 242 acadmies and schools, with 11,000 pupils; and provision has heen male for a systen of general elueation, as well as for the encouragement of inmicration.
GEOlidiA, the uame formerly applied in a general mamer to the region now called Iassian Trunscaucasia (see Travscatcasia), which forms the isthmus connecting Europe with Turkey-inAsia, and is bounled by the Cancasian momatains on the north, and ly the Armenian iwountains on the south. The Persian name is Crujestan; the linssian, Crusia ; and the native, Iberia; the name of $G$ arose either from the numerous lings called fienge that rulal over the conntry, or from the latron saint heing St George.

The early history of the Georgians, who trace their migin to Thargamos, a great-grandson of Japhet, is wrapped in fable. Altskhethos, who is said to have built Mtsketha, the ancient capital of the country, the ruins of which are still visible near 'liflis, plays a prominent part in it. They appear, lowever, in authentic history in the time of Alexander the Great, to whom they sulmitted. After the death of Alewander, in the year $324 \mathrm{e} . \mathrm{c}$., they were delivered from a foreign yoke hy Phamiowas, and united in one kingdom. With Pharnawas hegins the series of the Mephé or kings of G ., who, under a variety of ilyuasties, ruled the comentry almost withont interruption for more than 2000 years. By the end of the 4 th c., Christianity lad diffused itself throughont the comatry, and through it $G$. became connected with the Eastern empire, with which it joinel in repelling the attacks of the Sassanides. After the empire of the Sassanides had been destroyed lyy the Arabs, the latter carried their conquests into $4 .$, which now became a province of the Arabian Califate. Toward the end of the

Oth c., during the decline of the Aralian Califate, the Georrians recoverel their indepenelence for a short perioh, but it was only to beeome tributary in the 10the. to those dynasties which, in Persia, trok the place of the Califs. Toward the end of the loth c., they again achieved independence, and inaugurated the must brilliant era in Georgian history; for from this period to the 13the., when they were concured by the Monrols, G. was governed by a series of able sovereigns, who incrascal its exteat, repulsed its concmies, and raised it to great prosuerity. Toward the end of the lith e the country fell into the hands of Thimour, who, however, was driven from it in the berinning of the following century ley Geor, VII. Alexander 1., the successor of icorge VII., eommitted the fatal error of dividin! the Eingdon hetween his three sons. Eith of these states was again divided, and at one time of different 1 minces reigued in Georia. The general history of ( 1 . now divides into two parts: that of the castern states, Karthli aml Kacheth; and that of the western states, includine Imereth, Dingrelia, and Giria. From the loth to the Isth e., the castern states had been licavily oupressed hy Persia, and in 1-99 Gregory N ., after many attempts to "stablish their independence, resiguch the states in fivour of land Vimperor of liussia, and in 1802 the Empero Nexander proclained the territory a liossian province. Of the three states firmin Western (i., (rucia full into the hands of Russia in 1801, and formally surreulered itseli to that empire by the treaty. of 1810; Mingrelia was virtmally added to liussia in 1803; and the state of Inereth towarl the close of the 18th eentury. Thus the whole of G. has been brousht under the dominion of Pussia, and has been unitel, along with the other 'Transcancasian possessions of that country, into a general goverament, the head of which unites in his own person the military and civil powers, and cxercises military supremacy over the whole of the Caueasus. For the character of the country of G., amd for its eapabilities, see Tensecucash.

The Georgians are one of that numerons group of nations in tribes that inhalit the Cancasus, to which Dr Latham has given the name of Dioscurians (see Catcascs). They are celebraterl for their leanty, and under the Nohammelan rude, the white slaves of Western Asia and of Egylt were mostly drawn from among them and the Circassians. Thongh endowed by nature with mental no less than physical alvantages, the long course of oppres. sion to which they have been smbected has had its edfect both uion their intelligence and their ruorality. Despite the long supremacy and cruel tyrany of their Mohanmedan eonquerors, they have, as a nation, remaned faithful to the Christian rebgion, according to the doctrines of the Greels church. In Guria, however, nearly half the inhabitauts have gone over to the religion of Islam. The condition of the people, although somewhat ameliorated under liussian rule, is on the whole deplorable.
The language of the Georgians is harsh, but regular and forcible. It has a peculiar structure, and Dr Latham considers it as having nearer alfinities with the Tibetan and other monusyilabe tongues, than with the Aryan. The hitcrature, which is not altogether unimportant, begins with the introduction of Christianity into the country, and consists chictly of ecelesiastical writings, trans. lations of the Dible, the fathers, Plato, Aristotle, and their commentators. Profane literature flourished chiefly in the 17 th $c$., and consists mainly of poetry and ehromeles, particularly of an ecelesiastical character. A few heroic poems may be traced
back to the time of Quecu Thamar (1184-1206). Scientific works are fow in number, and with the exception of a few historical works, are of no imprance. liceently, however, a greater zeal in the cultivation of the sciences has legun to shew itself among the Georgians, aml under the liussian government the system of education and instruction has irogressed consiterably. On the nther hand, it must be regariled as a circmastance unfavourable to the mental culture if the conntry, that, in 1807, the archives and seivatitic works of $G$. were conveged to St l'eturshurg. The jerson most thoronghly conversant with the lannuage, literature, and listory of $(9$ is Dirusect. Desides the translation of a Georcian chromicle, he has publishaca, among other works, the Elements de lit Loname Grorgienne (Paris, IS37), the Raprort sur un Vopuge Archeologique dens la Geminie et duns l'Arminio, exicute en 1847-1848 ('ectershurg, 1550-15.5), L'IIstoire de he Georgie. in Georgian and French, and Additions et Eedarcissementa it CMistoire de la Georgic (Petersburg, 1851).

## GEORGIA BAISK. See Pincrsmia.

GEOLGBWILLIE, a small town on the northern border of lbhemia, 64 miles worth of Pragne. It bas a mineral spring and some manufactures of linen. Pop. 5 (\%).

GEOTELTHLS, a gunus of forsil calamaries, feculiar to the (obtic jeriod. The shell or horny pen is hroal and trmacated in fromet, and pointiol behiud, with the lateral wines shurter than the shaft. Some spucimens from the Uxturd clay are remarkably prescred, still shewing the muscular mouth, the bases of the arms, aml the ink-bay. The iuk has been mate intus Sepias. Sume of the ink-bags from the Lias are nearly a fuot long, and are invested with a brilliant nacreons layer. Cpwarls of a duzen species have leen formel.
GEIA, a town of Germany, the chief place in the small pincinality of Iteuss, is pleasautly situatod on the right bank of the White Elater, :3 milas south-south-west of Leipsic. It is handsomely built, with broal and regular strects, amb has six squares, a castle, a fine town hall, and several rebinus and educational institutions. There are extensive manufactures of woillen and enton goorls, also machine making, and manuiactures of soap, gloces, leather, hats tolaceo, waxchoth, ironware: stoneware, and purcelain. The recent prosperity of the town is seen in the increase of the porulation from 11,300 in 1543 to 17.571 in 1571. A large mannfactory of harmonicas cmpheys 600 hands. Leer is extensively manufactured for expont.

GERA'CE, an anciont commercial town in the south of Italy, chicf town of the Wistrict of the same name, in the manince of Calabria Ultra 1 ., occupies a beautiful anl fertile situation on the urper slopes of the Apennines, at about inar miles distance from the Ionian Sea. On the destruction of the ancient town of Locri by the Saracens in the l2th e., the inhabitants, out of the rums of their homes, constructed a new settlement about four miles from the site of Locri, on the seashore, and called it Santa Ciriace, which has since become Gerace. This town bas suffered severely from repeated earthquakes, in one of wheh, in 1753 , both the cathedral and the citalel, a fortress of great strength, were reducel to ruins. In a neighbouring plain are secu runs supposed to occupy the site of Locri E]izephyrii, an important city of Magna Grecia, eelebrated by Pindar in more than one of his odes. Cuins bearing the epicraph of Locri have becn found in the vicinity of the ruins, and together with the Greek character borne by the ruined edifices, seen to support
this supposition. The motern G. is well-buit, amd uwes its commercial prosjerity to its silk factories and its trade in wine, a swect white limel of which, known as 'Il Cireco di Gerace', is deservedy hed in high repute. Paps, about (6000.

GELANACT1, a genus uf exnceuous plants, the tyln of the natnral inder Gementeres. the limits of which correspemel with those of the Linuewan genus.

a, Germimm: $b$ I'darceninm:

This order contains at least 5ot linown species, very monpally distributed wer the worlh, and particulirly abounting at the C'ape of (roml Inope, of which wountry most of the species of the large genus P'lomgomimo are natives-a genns distringushed by an irregrar corollia and by a nuctariferous tube ruming dasn the flower-stalk. Many species of Ploi'gonium, and many time hylorils and varieties protheed liy cultivation, are to be seen in green-houses, and some of them are fregment in cottage-winuluws. The name geranimm is still very frequently given to them. The Iritish Ceramiaretr are thirteen species of Gicronimm am thre of Erodiam, all herbucenos, Some of them are common weels in tiellets and Gariens, with small flewers: others have large and Disantifd flowers, and are among the finest omaments of groves and meadows. Some species of ficranium are often enltivated in flowergardens. The mame Gieraninan (Gr. formos, a cranct, the Impular Enghish mame Crone's-bill, and the German storchanabel, all refer to the heaked fruit. 'I'he dironuces are gencrally characterised hy astrinaency; many have a disagrecable, others a pleasantly aromatic and resinons smell, some a delightful fragrance. The stinking Crave's-bile or Meme lenbent (Geraniun Robertianum), a common weed in liritain, with a diffuse habit, leeply divided luaves, and small tlowers, has been used medicinally
 muculatum, a North Anerican species, witl flowers of considerable luaty, is the most valuable medicinal Ilant of the order. Its root, ealled Ales Foot in America, is extremely astringent, and athonds in timmin: it is used for gargles and as a molicine in wrious diseases.

A few Goraniucetr probuce odible tubers: thase of (itranimm tubrosm are eaten in the soutly of Eurupe; those of G. prareighoum in Van Diewen's Land, where they are known as Fetive Chrot; and those of Peluryonizon triste at the Cape of Good Hope. The leaves of Pelaryonium actusum and $P$. peltatum are edible, and gratefully acid. The cultivated Geramacece are proparated by sced or by cuttings; the shrubby kinds are very casily propa.
gated liy cuttings. They require a light rich soil: a mixture of leaf mould and samd is yery suitable. They are knot low ly proming. to inerease their beanty and make them more proluctive of flowers.

Glıalli, Emexne- Mavmer, (osme, Marshal of Pramee, was burn at Iamvilliers, in Lorraine, on the fth of April 1773 . He curolled as a volun. teer in the second battalion of the Dleuse, and served during the eampaign of $17512-1093$ unter Dumouriez and Jomidm, and afterwarls aecom. paned Pernadote om his crabassy to Viema. where he was the means of saving his master's life in the mélé that ensued on his arrival. After rising rapidly through the different grades of promotion, he was appointed colonel on the latle November 1800, and in 1805 aild-de-camp, to his frieni Bernadatte. He specially distimguisleal himself at - Ansterlitz (1805) in consequence of which he was alpointed gencral of lisisalle, at Ilalle (1806i), Jema (1506i), Erfurt (1806), Lintz (1809), and Wagram (1809). On the morning atter this last battle, how received the title of Faron of the Empire. He took part both in the wars of the Spanish Peninsula and in the Russian campaign : and in 1812 was made a general of division. Sulsequently, Napoleon named him Count of the Empine. After the tirst restoration, lie was named Grand Cross of the Letion of Honoms, ant Chevalier of St Louis, and received variuns honemable appointments. On the return of Napolem from Elba, G. joined hin, and commanked the fourth corps, mmbering 16,000 men. At the battle of Ligny, (i, was opposite to the centre of the Prmssian losition, which coverel Ligny, and was thus in the hottest of the fight. On the morning of the lsth of Jume, G. was near Winves, when firine was heard in the direction of Suignics. "un which a comacil was called, and if (i.'s advice ham bear taken, the battle of Waterloo might perhaps hase harl a dinerent result. After the second restoration, G. was whliged to leare France, and lid not return till 1817. He was elected a member of the Chamber of Deputies in 1sme : la also took an active part in the revolution of 15304 , and commanked the troops appointed to maintain order and tranquillity in Paris. In 1s:31, Lonis lhiliply appeinted (, a marshal of France, and gave him the command of the expelition to hiclgimm, in the enurse of which he distinguished limself by taking Antwerp in December 1532. In $153 J$ he suceeded Marshal Mortier as Grand Chancellur of the Legion of Honomr. He diel 17th of April 1855

Gifrard, Frangois Pascal, baron, one of the first bisturical and portrait painters of the modern French school, was born at Fiome, 11th Mareh 17:0. At an carly age, he went to France, and was apprenticed to Fajon, the sculptor, in Paris. He afterwards worked for some time in the studio of the painter Firenct, and in his l6th yar became the pupil of David, but his artistie carcer was interrupted for several years by the Tevolution. In 1795 , he exhibited lis first picture, 'Behsarins;' some time after, he painted 'Psyche receiving the First liiss from Cuphil.' Encomraged ly his success, he now turnel his attention to portrait-painting. Itaring gained Napoleon's iavour, he was loaded with hononss, and received, anong other enmmis. sions, that of mauting the battle if Austerlitz, perhaps the most successful of his paintings illustrating the canpaigns of Napoleon. But his grandest work -both as regards size and merit - is bis 'Entrance of Henri Quatre into Paris.' It is 30 feet wide ly 15 high, glowing with life, bright with colour, and accurate in costume. It was painted in IS17. $G$. was shortly after alpointed first court-painter,

## GERASA-GERHARDT'S NOTATION.

and raised to the rank of Baron ly Lomis XVII
He died at Paris, 1lth January 1857. G.,'s most celchrated portraits are those of Napoleon in his Cormation Robes, the Queen of Naples and her Children, 'Talleyrand, Talma, Louis Philipue, and Matame liécamicr. Of his other pictures, the lest kinwa are 'Ossian's Dream' (engraved by (iodefroy). '1lomer' (engraved hy Massarl), '1haphnis and 'hhuex,' 'Philje V.,' 'Corinma on the Promontory of Miscna.' 'St Theresa Kneclin, at the Altar,' and 'Thetis Bearing the Armour of Achilles.'

GERASA, in the time of the Rumans. was a city of I'alestine, on the eastern lourlers of Peraea. It was situated among the mountains of Gileat, alout 2) miles east of the Jordan, and 2.5 north of labl)-bath-Anmon, and attainen a bigh degree of prosperity under the Antomines (135-150 a. D.). On the rise of Christianity, it became the seat of a hishorric, but subsequently sunk into decay. (i is now duserving of motice snlely on account of its mins, which are said to be the most leautifnl anil extensive in that part of Palestine lying east of the Jorlan. In fact, it presents the alpearance of a city in ruins, lout whels still preserves its wriginal outlines. Great portions of the wall surroming the town are in gond preservation: there of the gateways are alowst ] rorect, and within the rity more than 200 columns are still standing on their jedestal:

GELElis, GEREA, or TFRE. (the Meninx of Strabo anc 1 liny), a small island on the north roast of Africa belonging to the state of Cumis, is situated in the ciulf of Cahes, and is separated by a strait from a headland on the slowe. It is about 20 miles long and 12 mikes lrume, and is fertile and populous. Shawls of hrilliant colours, beautiful silk and womben fanmies of the thest texture, bornous and blankets, are manufactured. This islaud contains a triumplal arch in honour of Antounus and Verus, and a framid from 2.5 to 30 feet in height, lunity un of the skulls of the spanish soldiers who fell here in a disastrous battle with the Turks in the Gth century.

GERhardt, Kail Friehicich, an eminent elwmist, was hom at Straslong on the 2lot of Aucust 1516, and died in that city on the 19th of August 1850. At the ase of fifteen, he was sent to the Polytechne Sehool of Carlsruhe, where his attendance at I'rofessor Walchner's lectures first awakel in his mind a taste for chemistry. After two years' residence in this town he romoved to Leijsic, where he attended the lectures of Erdmann, which sem to have developel in him an irresistible jassion for questions of sjeculative chemistry:

On his return home, he reluctantly entered umon the lonsiness of his father, who was a manfacturer of chemical protucts; lint the requirements of commerce seem to have been intensely repugant to him, and in a hasty moment of passion he enlistea (heing now in his twentieth year) in a regiment of chasseurs. He soon, however, fund a military life as insupportable as a commercial career, and in the course nf three montha he purchased his discharge, and at once set unt for the laboratory of Giessen, where he workerl muder liehig's superintendence for eighteen nomths. In lsis fie arrived in Paris, where he was combally welcomed ly Dumas. Here he gave lectures and instructions in chemistry, and, with Chevrul's permission, worked in the laboratory of the Jardin les Plantes, where, in association with his friend Cahours (to whose memoir of 11. we are indelted for many of the facts noticed in this article), he commences his important researches on the essential oils. In $18+4$ he was appointed
profesgor of Gencral Chemistry in the Faculty of Sciences at Nontpellier, and in the same year he marrid the goundest daughter of the late Dr James Sanders of lidinburgh. About this time he published his Prichs de (hamie Orguname, in which he sketehes the idea of 'Homulugons and Hetero. lngons series' ( $\mathrm{q} . \mathrm{v}$ ), which at a later period ho su successfully developed. In 1845, in association with Laurent, he commenced the Compus rendus des Tramaus de chime publios en Fronce t it C"tranyor, which were enntinued till 1Sts. In 18ts, he resigned his elair and returned to Paris, in ruder to follow out unintermpedty his special investigations; and in that city $h^{\circ}$ estallished, iwtween the years $1 \times 49$ aml 185\%, in successive memoirs, his views of saries (already, anlverted to) and the theory of types, with which his name will ho crer associated in the history of chemistry. It was there, also, that lue gave to the scientific world his remarkahle researches apon the anhylrous acids and the oxides. All his ideas and his disooveries are embodied in
 which forms, to use the words of his frioud and lingrapher Cahours, 'an important monument of mosern science.' He hat hardly completed the correction of the last prouf of this great work, when, after an illness of muly two days, he was surprised by the hand of eleath at the very berion when be sermal to the heginning to cujoy the fruit of his labours: for he hat just raceived the diphoma of corresponding member of the Academy of Sciences at l'aris, and in the previons year he was appointed professor of chemistry at Sitrashourg.

GEIRHAIDT'S NOTATION is now introducel, not only into numerous forcign works on chemistry, lut into some of our recent lioglish mannals-as, for example, ('oningtron's IIemdlowid of
 \&e: and boing employed by a large section if Enclish chemists-as, for example, I'rofessoms Williarson, Brodie. Lofmann, and Cilling-requires a brief nutice. On certain theoreticil grounds, Gerharit has doubld the combining or equivalent mombers of oxyon, carhon, sulphur, sclenia, and tellurium; the other numbers remaining unalterel. We give in the following table the ordinary and (arthardt's numbers

|  | ordinary | Gerhardt'a |
| :---: | :---: | :---: |
|  | Equaratent. | Lquiraicat. |
| O, | S | 10 |
| C, | 6 | 12 |
| S, | 16 | 32 |
| Se, | 89.7 | 7.95 |
| Te, | 615 | ] 2 ? |

The examination of a $\dot{f}$ w formule will reatily enable the rauler to transhate from one system into the other:

| Compounds. | Orrinary Inrmula. | $\begin{aligned} & \text { Oerbar } \\ & \text { formm } \end{aligned}$ |
| :---: | :---: | :---: |
| Water. . | 110 | $\mathrm{H}_{2} \mathrm{O}$ |
| Potash, | K0 | Ko |
| IIjenrate of Potash, | Kい,HO | kilo |
| IIrdrated Nitric Acin, | H0.s. | $\mathrm{NO}_{3} \mathrm{H}$ |
| 11 yiratel Suldhuric Acil. | 110, $\mathrm{NO}_{3}$ | $\mathrm{SO}_{4} \mathrm{H}_{2}$ |
| 1 lydrated Acctic Acid, | $110.4{ }^{10} \mathrm{C}_{3}$ | ${ }^{\prime} \mathrm{II} \mathrm{I}_{4}$ |
| Alcohol, | 110, $\mathrm{C}_{4} 11_{5} 11$ | $C_{2} 11{ }^{\prime}$ |

In Gerharates formulie we have printel in italies the symbols whose equivalents are changel. Each system of motation has its advantaqes, hut nuon the whole we are inclined to agree with l'rofessor Miller, that the question to be considered is not simply, what is in the abstract the best mode of notation, but what, eonsilering all the cirenmstances of the science, prossesses the greatest adrantage. That system of motation which is

## GERIZIM AND EBAL-GERMAN CATHOLICS.

consistent with itself, and wihich lends itself most completely to the expression of the varions theories and aspects of the science whieh have leen maintained, wr may be maintained, is therefore, philosophically speaking, the best. And such grounits, it appears to me, exist for continuing to use the system hitherto adopted.'

GERI'ZIX AND E'BAL, two mountains cele. hrated in Scripture story. They are separated from each other ly a natrow valley about 200 yards wide, in which stands the town of Nibulus, the ancient Shechem or Sychar, the metropohis of the samaritan sect. They are nearly equal in altitule, neither of them excecding 700 or so0 feet above the level of the valley, which, however, is itself 1800 feet above the sea. The view from the top of Nlount $G$., the sonthern hill, is said to be among the finest in Palestine, embracing, is it does, ghmpses of the hue waters of the Mediterranean on the west. the snow-capped heights of Fermon on the north, and on the east the wall of the Trans-Jordanie mountains, broken by the deep cheft of the lrook Jabbok.

In all probability, Nount (i.. and not the mere hillock called Moriah, on which Solomon afterwards built the Temple, was the place where Ahraham nffered up his son Isaac. Along with Mount Ebal, it was also the scene of a grand and impressive cermony, in which the whole people of Israel took part after crossing the Jordan, in obedience to a command whieh Jloses had given them. Half of the tribes stood urom the declivities of the one hill; the rest occupied the sides of the other, while in the valley between, the Levites, surrounding the sacred ark, yronounced. 'with loud voice', the blessings affixed to the performance of the law, and the curses affixed to the nerlect of it. According to the Mishna, their manner of procedure was as follows: They first turned towards Gerizin, and pronounced the blessing, whereupu the wast host that thronged the ascent of that lifll rolled back their multitudinoms 'Amen;' then turning towards Ehal, they uttered the corresponding malediction, to which the tribes there stationed responded in deep and solemn tones. In this way, alteraating blessing and curse, they went through the whole series. The narrative of the ceremony (which is to le found in the 27 th chapter of Deuteronomy) gives only the cursesthe customary explanation of which fact is, that probaldy these were merely the reverse form of the Hessings, and may have heen selected by the writer of the hrok on acenment of the reater awe inspired, amoner a rude peolle, by a malediction than a benctiction. it a later jerion the Samaritans, by fermission of Newanler the Great, built a temple on Nount G., as a rival to that of Jerusalem, an! organised a lival priesthond. Aurt thongh this temple was destroyed by Hyrcanas about 200 years after, the momntain on which it stoml continued to he hehl sacred ly the Samaritans. It was to Nount ('. that the 'woman of šauaria' refersed when she said to utur Saviour: 'Our fathers worshipued in this montain, and ye say that in Jerusalem is the wace whore men ount to worship.' Subsequently, ichristian choreh in honour of the Virgin was huilt on it, which Justinian surrounded with a strong wall to protect it arainst the assaults of the Sumaritans, who were even then a powerful and important sect. The ruins of this wall are still visible.

GE'RKI, a consideralle town of Africa, is situated in the Sulan, in the listrict of Sokoto, in lat. $12^{\circ}$ $26^{\prime} \mathrm{N}$., and luns. $9^{\prime} 10^{\prime} \mathrm{E}$. It is surrounded by a wall sumnounted with pinnacles. Its inhabitants are nuturiuns for their thievish propensities, and for
their aversion to agriculture, and, indeed, to any form of indnstry. Population estimated at 15,000 .

GERLACHE. Etiexie Constantis. Paron 1)f, a native of the province of Luxemburg, in Belgium, was born on the 26 th December 1755. In 1824 , he was elected as deputy from the province of Liege to the second chamber of the "States General.' At the time of the Rievolution, Gr. presided over the committee appomted to revise the constitntion, and was head of the deputation sent to offer the crown to Prince Leopold of Saxe-Coburg. In 1S31, he became president of congress, and in that capacity received the oath exacted from the king hy the constitution, and the following year was appointed first president of the 'eourt of cassation.' In 184", the king eonferred on him the title of baron. Since his election as deputy in 1821, he has snpported the Catholic party, and is now considered as one of their chief leaders. G. has also acquired a Literory reputation. The most important of his works are the following: Memoires sur les Changements a apporter unx Tarifs du Royaume, which appeared between 1821 and 1s94. and were addressed to the king: Histoire du Rovaume des Pays-Bas, depuis 1814 jusqu'en 1830 (Brussels, 1839), besides other morks of local interest.

GLIRMAN, SAN, a town in the south-west of the Spanish island of Forto Rico, stands in lat. IS ${ }^{\circ} 10^{\prime}$ N., long. $67^{\circ} \mathrm{W}$. It is situated abont 10 miles from the sea, in the centre of a district productive in cotton, coffee, and cattle. Its population is estimated at 912ら.

## GERMAN BARM. See Veist.

GERMAN CATIIOLICS is the name generally given to a religious sect that has recently sprung up in Germany in the brosom of the Roman Catholic Church. Though retaining the designation Catholic -i. e., universal-they form independent congregations, and most commonly style themselves Christian Catholics. So far as their general principles are concerned, the (r. C. stand upon Protestant gronnd; but neither in theory nor practiec are they erangelical Yrotestants, nor do they wish to he accounted such.

Whatever might be the deeper causes of the schism, the immediate occasion of it was the exhibition of the Ioly Coat at Treves. In 1S4, Bishop Arnoldi appointed a special pilgrimage and service to this relic, to be preceded by confession and remission of sins. This proceeling called forth a protest from t. linnge (prononneed lionge, the g lard), a priest in Silusia, who, having quarrelled with the authorities of his ehurelu, hail been suspended from his otlice, and was living in retirement. Ronge admessed a pmblic letter to Bishop Arnoldi, Octolyer 1,1842 , in which he characterised the exbibition of the coat as idolatry. lionge's roice found a vivid response in the minds of many Catholics, and was also approved by Protestants.

A short time previous to the mblication of this letter. J. Czerski, a priest at Schneickemithl, in Posen, had seceded from the Roman Catholic Church, and was about to form a congregation of 'Christian Apostolic C'atholics.' ('zerski and Fonge were naturally drawn into confederacy. Ronge at last addressel an appeal to the lower orders of the priesthond, calling upon them to ase thrir influence in the pulpit and everywhere to break the power of the conrt of Rome, and priestcraft in general, throughrut Germany ; to set up a national German Church independent of Rome, and roverned by councils ant synots; to abolish anricular confession, the Latin mass, and the celibacy of the priests; and to aim at liberty of conscience for all Cbristians,

## GERMAN, COUSIN-GERMAN PASTE

and periect frecdom for the religious culucation of children.

The lirst congregation of the new churll was formed at Schneidemihh, amd took the name of Christian Catholic. The confession of faith, which Was lrann up by Czerski, differed little in point uf doctrine from that of the ('atholic thurch. Thes Holy Suriptures and the Nicene Creed were ladel to bue the only standards of Christian faith, and were tu he understond in the sense patent to wery nulishtencol anul juous Christian. Nothing was sail arainst the worship of saints ancl relies, phtrimates, confession, \&e. This ('onfossion of sebucilumihl served many other congremetions as a grommbork, though some of then molilien? it in sarions ways, and exprossed themselves morts n- finitely. 'Jho new sect quinchly increased. At the heginning of $1 \mathrm{~S} / \mathrm{S}$, more than a humired congrequtions were in existence. The eongregation Which was formed at Breslan is मoticeahle from the confession of faith whide it issuchl, drawn up muler the inthutnce of Ronge, who hat heen chosen preacher. This confession completely dejarted from the doctrine ami ritual of the Iaman: Ciathalie church. 'I'lo Scriphure was lail duwn to be the maly rule of Christian faith, and no external antho. rity, it was added, can be allowed to inturfere with the free interpretation of it. Thes essentinls of helief were restricted to a few doctrines: buluf in God as the Creatur and (rovernor of the worlil, and the Fathur of all men; in Christ as the Saviunt, in the lloly Bjirit, the holy Christian Chmreh, the forgiveness of sins, and cternal life. Baptism and the Lord's Supper were held to be the only sacraments. Contirmation was retained, hut most of the rites and practices pealiar to the Roman Catholie chnreh were given up.

The need of something like concert leing felt, the first council of Cerman Catholies was held at Leipsie, Mareh :2., 1845, and attendel by deputies from many of the leading congregations, others signifying their willingress to abide lyy the decisions that mipht be come to. The principles of the Breslan ('onfession were mostly adopted. The interpretation of Seripture, the only sonree of Christian helief, was luft to the free exercise of rason, yervader ami actasted by the "Christian illea.' Forms of worship" were to le adapted to the requirements of time and flace. With regard to chmreln government, the conncil declarel in favour of the presbyterinl and symolal constitution. The congregations were to have the free eluction of their clergy and chlership.
lhe eflect of this nnion was to increase the munder of congregations, which by the end of $1545^{2}$ amountel to about 300 . Numbers of leading ('atholics, professors and others, juined the movement; and learned l'rotestants, like Gervinus, lookel upon it as a momentous crent in the listory of Cirmany. Indivilual lentestant elergymen went ower to the borly; and all those Protestants who, from dissatisfaction with the state church, harlformed what are called 'free' or independent congregations, entered more or less into relations with it. The local boards and magistracy also shewel great favour to the cause, and often supported it by granting the use of protestant churehes, and even funds.

Bat German Catholicism was destined soon to find enemies both within and withont. 'lo say nothing of orthodox Catholics, conservative Protestantism legan to suspect it as an undermining of reliston in general, and dangerons to the welfare of church and state. And as the movement fell in with the liberal teudencies of the times in general, the governments took the alarm, and set themselves to check its spreal. Saxony took the lead, and lrussia soon followed, in imposing vexations, and even
tyrannical restrictions mpon the 'Dissidents, as they were stybl hy the inthorities. In Baden, they were even denied the rights of lourghers, while Anstria, pre-minent in religiuus bigotry, sent them out of leer territuries.

It was more, however, internal disagrements than state persecnations that checked the prosperity of Giorman Catholicisur, as was to be anticipated from the wide discrepancy hetween the views of Crerski and those of lionge. Czerski and his atherents helel closely by the doctrines amd ritual of lowne, and issuad sucessive coufessions, layiug dram more and nure delinitely the essential juints of lelief, such as the divinity of Chast, and , ther positibe lhe trines. lionge's pasty, on the other liaml, approwhed nearer and nearer to the liationalists, and, leaving the province of relifion altorecther, ocenpicel themselyes with frecothinking theories and remocratical polities. 'This led to mumerous disargecments lectweed congreqations and clereytucn, and liscouracred the spreal of the novenent. Whan the scoond conncil was hele in Serdm in 18t\%, the interest had greatly derlined.

When the great storm of $1=18$ lurst, the German ('athuhes, as well as othor lollies, had free space fur their exurtions, whiel, howurer, tuok mostly a political direction. Some additions were made tu the number of the consreyations, especially in Austria. lunge was active in trasclimg and preaching, aml althongh his frecthinking amd politiral tendencies wre repuliated by mumbers of the body, they predmanaten! in many places, and found expression in a series of poblications, among others, in Lan's C'atechism of the Christiun Feligion of Presson, amd Nhell's livok of leligion. After the political reaction set in, strong measures were taken against the German Catholics. The early enthusiasm of tho morement apparently died out, and after the dissolution of the Frankfurt parliment, longe retired to Lumdon, where he has since resided. 'lhe individual congregations once formel still contimue to exist, though in a depressed condition, except in Austria, where they have been altogether suppressel. A conference was heh! at Kithen in 1850, at whieh it was laposed to form an allinace with the liree congregatious formed of dissenters from the frotestant charch, and a rlict was ixed for 15.52, but it did not meet. Since then, Gemman Cathoheism has licen raphlly diminishine all nver Gemmay, and at the Gutha conference of lș5 there were ouly 42 representatives present. Cumpare kimpes Coschichte der Lieligusen Lewogunyen der houeren Zit (Leip. 1856).

GERMAN, COUSIN. Cunsins-gemman, or first cusios, are those who are relaterl to cach othere loy their fathers and mothers having been sisters ur brothers, or the father or mother of the ono loing the sister or brother of the other. The turm has no relation to German, in the sense of 'Icutonic, but cones from the Latin worl fromomus, which again is derived from germen, a young bud or lranch. Cousins-german are, therufore, tluse who are the buds or branches of the same tree, and they have in reality always one grambather in common.

dERALAN PHILOSOPIIY. When we speak of the philnsonhy of Gemmany, we do mot necessarily imply that it atifers from the philosnhy of any other country in respect of the problems it socks to solve, any mone than when we compare the ferman chem. istry with that of France or Fongland. To characterise ferman ${ }^{\text {dhilosmhy, means nothine nome than }}$ to point ont the peculiar path that farman thinkers have followel, and the degree of suemes that has attended their investications. in secking to answer thuse speculative questions which are mulerstoon to form the domain of falosophy, and which concern all men, if they ennem any: Understiond in this sonm, fierman philosophy clams it high phateaccording to many, the highest. At least, fin almost a contury now, a more ganoral interest has leen taken in the cultivation of philosoghy in Cimmany than clsewhere, and alstruse and deep speculation has been chiefly represented ly German thinkers. That country has thos made up for the groum she lost by continuing to allere to the traditional forms of scholastic philesonhy after they haul wen forsakin in France and England. This spead of phitosmbic enlture was comedent with the perfecting and alaptation of the derman language to prose compo sition. For though Joblonitz contined himself in his philosophical writings to the latin and Freneh lancuages, (hr. Thmorsins, about the same time, hat hecrm to amploy the mother-tongue hoth in acalemic lecturiur and in writing, a practice which was extendel hy the numerous writings of chr. Wolf. The expansim of Geman literature in the last half of the 1 Sth $c$. completely emancipated speculation from the trammels of a forcism ition, and alongside of a rich poetical literatire there sprang upi a philnsophy which may chaim comprarison with that of Cirecce.

As regadis the scientifie characteristics of Gimman philusminy, it may be remarked that the systems put forth by laculi in England, lescartes in France, amd Suinesa in 1lulland, lad lout little intluence in dermany at the time of their appearance. It was Locke that dirst awakened ant emsiderable attentiom. The empinicism of this philospher, who grounts all knowledge on experience, and makes bisyelnogy the regulator of metaphysic, called forth the onnasition of leilonitz, the first German that mate an cfuch in the history of modern philoseghy, and who, from the varied impulse he communicatel, mast be lowkel upon as the ereator of the philnaphic spirit in Germany. At the same time the fundamental dectrines of Leibinitz's system-that of monads, of a pre-estalidished harmony, and of imate ileas-were rather genial byotheses than regularly estahlished mon, itions. Toremedy this, Whilf endeavoned to eonstruct a system of philosonly complete in all its garts as required liy the forms of lagic, in doing which, howewer, hu set aside pecisely those ductrimes that furmed the characteristics of Labnita's philosondy: The great intluence exercised by Wole is shewn ly the wide circulation of his witings, and the multitude of his disciples and adherents. Wolf hunslf, however, outheal his fame, and the original phinesophic mind in Germany went to sleep for a periok, during which a sort of Eelecticism, without any funhamental jrinciple-the so. callay philusphy of 'cummon sense,' prevalent in Lhyland and France in the 1 sth c.-hecame generally sprad. This periox, however, was not without great intellectual excitement of other kinils. Poetry, refom in education, polities, and religions enlightennurnt, kenly occupied men's minds: oll customas and ansociations, both in family and nolitical life,
were shaken ; and preparation was silently going on for a great amb radical revolution.
kant, with whom the next periol of German I hilosophy begins, thus fonnd an age ready to rececive impuessins : amp, althongh the Kritik der himon l'trunfot (C'ritique of the I'ure lieason) was at first in danger of heing overloked, when a hearing was once oltained, that and his other critical works, which, after long preparation, appeared in rapit succession, commmicated a profomb impulse to the scientific worlh. This arose nut more from the nowly and the comprehensiveness of his researches, than from the circumstance that their aim fell in with the tendencies of the age. The exclusion of everythine dictated by caprice or sentiment, the mantenance of the independence of speculative innuiry, the reference of all therretical speenlation to the tield of experience accessible to it, and the clevation of the noral elment to the highest and ultinate object of all hmman endeavour, form the leading traits of his philosomby, which he recommended to consideration, more from its importance to man and society than to philosophers. We also cutertainel the hope that, through the critical inguiry into the nature of the hmman mind, it might he prosible to reconcile empiricism and rationalism, sensualism and spiritualism, and other philosophical "Ipusites, amd liscover a series of comprehensive principles to which all philosophical disputes might be referred in the last resort. This hope was disappointen; among other canses, heeause Kant souglit tor gromed the old metaphysic of the schools on a psychungy which itself restel on the hasis of that metaphysic. Besides, there was wanting in the heyday of Kantism any satisfactory point of unity for the seweral parts of philusoply: K. L. Teinhold was the first to pmint out this defect ; and scepticism, as in C'. Schulze's EXntsidemes, ant dugmatism in tho writines of Eberhard and nthers, carried on a War with the "critical' philosophy, but mot, it must lwe eonfessed, with any great suceess. It was Fichte Wha fomm, or thought he had fomm, in the fact of conscionsness. that alsolute point of mity which Kaut's "Critigne' had always minted to. Fiehte, following ont the path on which Kant hat enteren, changed the hali-idealism of kant into a complete idealism, by declaring the Dge to he, not only the hearer and source of knowledge, hut the only reality, the world being merely the ideas and active manifestations of the Ego. In the ego, leing amd knowing werc ilentical, it was at mee existence and knowledge, and mature appearel only as the reflex of its absomate activity.

With this ideadism legan a kind of revolntionary exeitement in the philosophising minds of Cermans, which contrasted strongly with the calm and soher spirit of Kant. System followed system; philusophical books appeared in sloals; and for a puarter of a century and more the interest was shared by the public in general. but the meteors that appearel in the phalosonhical sky of Germany vanished for the most part as suldenly as they had blazed forth. Schclimg was the first that attained a general infonence. IV. H. Jacoli had previously recalled attention to Spinosa, and Schetling, intluened by the speculations of Spinosa, eonverted the idealism of Fichte intor what is called "the philosophy of identity.' This system set out originally with the assertion, that as Fichte educes nature out of the egn, so ly an inverse process the ess may be educed ont of nature; but that looth these furms of $1^{\text {bhilosophising }}$ lave their ground in the alsolute as the inentity of all oprosites-of the real and the ideal, of subject and olyject, of mind and matter. In carrying out this assertion, Schelling fixed upon intellectual intuition as tho

## GERMAN PHILOSOPHX-GERMAN SILVER.

kind of coguition alone correspourling to the absolute, or rather as identical with and representing the absolute. The organ of this intuition was called reason, and, as such, was opposed to the redection of the mulerstanding, which was lielil to be quite ineapable of taking cognition of the alsulute. 'I'he relation of the phenomenal worlh to the aberlute was hrill to consist in this, that the absulute represcuts itself in the multiplicity uf appearances, stops ont of the state of "inditierence" into that of "dilicer conce,' manifests itself in ' differemee, de. Taking $^{\text {en }}$ special caser. particularly an natural phibosophy, Sohelliner emearourel to demunstrate the "xistebe of this idmatity in the midst of non-identity, and of non-identity in the milst uf ilentits. In thas attompt, howevor, ne ither somelling wor lis disciples effected much. For in undervaluing and nowlecting uxperience and retlection, the duor was agencel to a fanciful mbule of speculation. which in most cases lad little more in common with science than the name; so that in the departments of pretry, religrom, and sucial life, the Rehelling phiksumbe often dowenersted unto a blind gropinus, leating to the stramest aborations of romanticion. mysticism, annl temelany to Coatholicisn.
'lhe philosulhy of $H$ (rfe] (1. $\%$ ) tomk the same enneral direction as tlat of F'whte amol schelline. Hewel attemped to develop, in rembar meranisation, the enntents of the intellectand intuition (in plain wonls, the engnitions and illeas of the minil) by the diabectie rer lowieal methoh. Thomah lee loroke louse from the gevalent fashion of imblubing in an nutriderl play of fanciful combinations, he clid not content hinself with the mules of logie reenenisend far thousmols of rears, hut sourht an expersion for speculativo thought in a lialectic of his own. The essenee of this transecmental logic eonsisted in the analysis of all the establisled general eonceptions: and the process or method consists in makinf each conception of itself grmerate its oflusite, ant, combining with this orposite, thas lecome enriched anul amalled tor advanee to still higher stages. This mothon Hugel, with enduring perse. verames, emparomed to carry rot through the whale fieh of fhilnsingy; and diviled his syatem int.) the three provinces of logic, philusquiy of nature aul fhilusinly of minl.
While the systems abowe consilurel furm pretty mulla a cimtinucus line of progress, that of J. F. Horhat (4. . \%) , wn the contrury, aruse in thosition to the inealion of Fidite, and tuek a direction in Complete antagrnism th the duminant sceular philusinty ; and when we lave nuncel Herlart, alone with Sichelling and luect, we have named the enly men that, since the chia of Kant and Fichte, can lay clain to extemen and crecral influence. Fur the well-nigh imumerahle pinmetions of other thinkers in this shppratment, though often of individual merts, are only if secomary importance for the develulment of fhilusoply as a whale. None of thena (nenell up any mew learing path; they are oceuniced chiefly in defencling or remoleling obler systems, anil apllyine then to particular departinents of srifnce, or in controversp with the dominant philosenthy of the lay. To this catemeny belong the Kantian systems of Krus anl others; the physical spuculations of Stettions, Oken, Schubert, Re; the variwns attempits t. lead incie philosophy to emprical pychnogy the peculiar speculative attempts of selidiermacher, I. J. Wagner, Fichte the younger, A. Trendlenturts. \& . : the different twmencies within the Hegelian school; and lastly, the 1"sition which Schelling lattely towk up with regaril to his nwn earlier doctrines, and to the development given to them by others.

While philosophy during the last half century
was thus actively prosecnted as a science, a corresponlinir interest was taken in its history ; in fact, it was hermans who tirst sought to gripple with the history of philosophy" as a whole, anol to throw light upon the prineigral doghartments of it ley valuahle special treatises. See D'llomsulum. The rapind sucession of systems one after athother, aml the extravarances juto which some of thom ran. have. it is trme, probluced a lull in the inturnst taken in speculation ; and to the formar - 1 thtumasm there has sucereded a semptical avorsion to all sperndittives iuquary. Still the inluence that pholusimly has had in clevatime and stronetheming the sumatifo min! of Firmans, has leen powerful and laneticial: and there are few departments of mestroh in whirh the froits of the filibisplaic spirst buty ant bue
 treathrent.

Mans otler formulat are in use arising from dithonce of opimion amonest the manmiactures as to the boot propertions for their respective oprations, u-nally. however, the aim is to obtrim a sibery whenemes, and the largest projurtion of mallealality.

This alloy must not he confonmled vith other white alloys, such as Albata, Eritamaia metill, im? nickel silver, which are usol as sulostitutes fore the true Cierman siluer. The first ut these is mandmastit of copper, zinc, nickel, and a little lonk; the second uf comper, ainc, tim, antinnony, aum sommetimes bismuth; aml the thorl of copprr bow, mickel ons, zine 17.3 This last hiffors umly in its promotions from the berman siver; it has the colmer of bighly polished sulver, and is very haril. The colour of Goman silver lanes so ne:w that of the precious motal, it is garticularly wall alapted for plating eithor ly the wha proctss of rolling with silver, wr in the newer and now spmerally used process of electro-plating; the alvantapes are that a thinner deposit of silvor can be hasell, and the articles made are not liable to the olipertion of the ohl process of plating on copper, whinh as som as the silver hegan to wear ofl was reudered apparent by its real colour.

As alloys of the nature of (iemman silver are easily oxinisell when bromeht in contact with free acius (as, for example, with the arotic aciul containud in vinegary. and as the salts uf leal, cerplper, and niekel, that are thus furneal are mosmons, it is nut expedient to nse spuons, dishes, \&e., comprosed of Cremman silver.

The extent to which it is now useal is very great indecol, anl, cowhined with relectro-depositiog, it las been the means of abling immensely to the national industry, the manufacturess of Firminghama and shembed supllying every quarter of the elolve with a profusion of articles uf taste and utility in elretron bate in beautiful designs, and rivalling genuine silfer-plate in beanty of aprarance.

German silver derives its name from the fact that
it was first made at lifikhorohansen, in (iemmany, where it was made by smelting the ores of the mutals above-mentioned, and a small proportion of irm ore also: this last, however, is very rarely usel num, althmoh it adils to the silvery whiteness of the alloy, lut it monlers it mane brittle.

(:1NRMA'SDER (Teumoinu), a genus of plants of the natural orver Labiater, laviong the calya

Germander, or Wool Sage (Tu ucrium Scorodoniu) : a, corolla; $b$, calys, with jistil.
rimolla with the upper lip wery short and hipartite, the lower lip spreading and trifid; the stamens much exserted. 'l'he spueies are mumerons, anul very widely distributed. A fow are natives of
 (hrys), often found on ruincl walls, has probably laen introlucesl from the sonth of liurope. It is a small, almost shrubly, peremial ; with wedgeshaped ivate inciso-serrate leaves, and whorls of ahout three larce redilish purple flowers. It is litter, somewhat aromatic, and was formerly much used in mulicine, particularly in cases of gont. It was a principal ingredient in a once famous gout meticine callenl porthend pouder.-Similar menticinal virtnes were ascribel to $T$ Botrys, a small inmual species common on dry hills in Germany; with aromatic fragrance and yellow tlowers. Woos (t. or Woowsiae ( $T$. senotomin) is a very common liritish phant, growing in dry lushy or rocky placus, with ohlong-nate very much wrinkled leaves, and one-sidel ricumes of yellowish-white flowers. It is wry litter and slightly aromatic. It is used in Jersey instorl of lips.-Water G. (T' scordium), a rare British species, growing in wet meadows, has a smell rusembling that of garlic. It had ouce a great reputation in medieine.-Cat Thyme ( 7 . Marum), is native of the south of Lurope, abounds
in a pungent volatile nil, has a camphor-like smell, and-like catmint and valerian root-has great attractiveness for eats. It is often used as a sternutatory; and its $l^{\text {nowder snuffed into the nose }}$ has proved very bencticial in cases of polypus.-A species fomm in Cochin-Clina ( $T$. thea) is usen there in infusion as tea.

GERMA'NAA was the geaural name unter which the Fomans elesignated not only great part of modern Germany, lout also a portion of Belgimm aml the north and north-rastern listricts of Gaul, the two last heing more especially charaeterised as 'termania Prima' and 'Scennda,' while Germany projuer was also ealled 'Germania Magna,' 'Germania 'Traus-thenana,' or ' (Femmania larlara.' The bountaries of the regrion comprehended under these designations were-on the west, the lihine and ('eltic Gaul; on the cast, the Vistula and the Carpathian Momatains; on the sonth, the Dambe; and on the nortl, the sea, which was divided by the Cimbrian Chersonesus (Jutland) into the German and the Snevic (1altic) seas. The first occurrence in enmection with the history of the people of $G$. with which we are acquainterl, was the appearance of warlike tribes of Cimbri and Teutones in the presunt Steiermark or Stiria, where they defeated the Ioman consul Papirius, in the year 113 E.c. Eleven years later, they again came into collision with the foman arms, but the result was their signal defeat ly Marins. The names Germani and Germania do not seem to lave heen appellations in use among the people them. selves; and it is probable that the Romans horroved them from the Cranls or Celts, in whose language the worl 'gairm,' a lond cry (like the Homerie boin dgathos, 'gond at the war-shout'), may possibly have served to designate this poope, whose habit it was to aceompany their attack on an enemy by lond cries. The Tungri wore the first German people that crossed the Mhine, lut other tribes soon followed; ant when Julius ('iesar opened his Gallic campaigns ( 55 e.c.), he found the ( $e$ ermanie nations of the Triboci, Nemetes, and Vangiones in possession of the districts lying letween the left bank of the Rhine and the Vosges, while he even encountered a rival preteniler to the supremaey of Canl in the person of Ariovistus, the leader of the Sneric tribe of the Marcmanni. All these tribes were, however, fimally reduced to suljection with the rest of Garul, while the Tencteri and Usipetes, who hal invaded Belginn, were driven, together with the Sicambri, across the Rhine to their former settlements by the victurious general, who for the first time ( $\quad$ as r.c.) led a Imman army into Trans-Hheme Germany, The quiet which Cossar's rictories had secured in the Shenish districts was again so serinusly disturled hy the Usipetes and sereral of the neighbouring tribes in the year 16 p.e., that Aurustus, who hiad hastened to Gaul on the outhreak of disturbances, saw that stringent measures must be adopted to keel, the Germans in check, anl sent Drusus at the head of eight legions into Germany. The first step of the Roman general was to dir a canal ('fossa Drusiana') from the lhine to the lissel, hy which the lioman galleys conld sail from the huart of the continent to the ocean; and so successful were his measures, that in the course of four campaigns he had carried the Romana arms as far as the Albis (Elbe), subdued the Prisii, Batasi, and Chauci in the north, and defeated the Catti of the Momus (Maine) districts. Drusus, who died 9 B.c., began the series of forts, brilges, and roads which were completed and extended under suceceding commanders. The attempt made by Varns, under the direction of Augustus, to introdnce the lioman $1^{\text {rovincial forms }}$
of administration into Germany, brought, however, a sudden check to the adrance aud consolidation of Roman power; for the tribes of C'entral Germany, imbigoant at this attempted subversion of their mational institutions, rangen themselves under the lealership of Arminins, a chief of the Cherusci, who manisel a general revolt. The result of this movement was the destruction at the Saltns Tentolergionsis of the three legions commandel? ley Varus, and the sulsequent loss of all the limman jussessions between the Weser and the lihine. The news of this disastrons erent threw the city of liome into consternation. Ciemanicus, who was sent forth in 1t A.1. to restore Roman supremacy, woull probably have again wholly sub. jugated the Germanic tribers hal ho not leen recalled by Tiberius in the midst of his victories. From this time forth the Iomans coased their attempts to conquer Germany, am contunted themselves with repelling the incursions which the tribes mate on their frontiers, and endeavomine by theis influence to fostor the intestine disturlances which were perpetwally generated through the ambition and jealousy of rival leaders, such as Arminins, Marlondins, and the Goth Catualdia. After the murder of Arminius ly his own penple, the pwer of the Chernsei liclineil, while the Longolsardi and Catti began to assert a recognised prequmberance among the meifhbouring tribes. Occasional encountors took place between the people of Central Germany and the legions who guarded the wellprotected Jioman bounclary-line, which stended from the lhine to the Tamins, and from thence to the Tanube: and from tiane to time the Batavii and other warlike tribes of the north and northwest, who, like them, hail heen brought into lartial dependence on the Liomans, rose in formidable insurrection: lut after Tiajan had restored orler and strengthencd the forts, peace remaned undisturbed in the north till the begiming of the 3 l c . while, with the exception of the samgunary war of the Darcomanni and Quadi meder Anrelius Antonious in the year 166 A.D., there was a similar absence of hostilities in the south. Bat with the 8 dc , the tide of war turnel, and the liomans were now compelled to defend their unn empire from the inrouls of the numerous Germanic tribes, foremost among whom stool the pewerful conferleracies of the Alemanni and Franks. In their track followed. Aluring the next two centurins, successive hordes of the Vandals, Sueri, Heruli, Tuths, and Lungohards, whon som formed for themselves states and mincimalios on the ruins of the old Laman prosincts. From this perion till the estahlishmant of the western empire in the person of Charlmame the history of Gormany is a blank ; lat the condition of the comenty when be cutered on the possession of lis cerman patrimony, shewed that sioce the retirement of the lomans the lesser trikes hat become gradually absorteel in the larger, for on his accession the land was heid liy a ferw crat nations maly, as the Saxous, Frisians, Framts, suabians, and Bavarians, whose leaders exereisul sovereign I ower within their orm territories, am in return for military serrices, parcelled out their lands to their followars.
The knowlelge which we jossess of the habits and govermment of the ancient Germans is peincipally derivel from the Commentarjes of Cesar, and the 'Germania' of Tacitus; and imperfect as these sources of information are, they are intinitely less erntradictory than the sulsequent records of the Earliest Christian times. Accorling to the Foman historians, the Germans were a people of high stature, fair complexion, and red or yellow hair, chdowed with great bodily strength, and distinguished fur an indomitable love of liberty. The
men delighted in active exercises and the perils of war, and the women, whose chastity was without rejroach, were beld in high esteen. Each master of a fanily hal absolute power over those of his humseholn. Their habitations were ateverally separate, and surroundel ly their several stalls and garnurs; for although there were villages whose inhahitants made combon use of the cields and wools surromdines them, the Germans seem to have prefored isolated and detached dwellings to agyregate settlements. Towns and cities they long regated with aversion, as inimical to personal freerlom. In regari to their political or ganisation, it would alpear that several villages formed is 'handred,' sorycral hundreds one 'rain,' and several gaus one tribe. In each tribe the penple were divided into four classts-nohles. frecmen, freedmen or vassals. and slaves. The ling or chief was -lectel from among the nobles; hat his power was very limited, and the government of the several tribes secms to have been demueratic rather than monarchical.

The religion of the Giermans, which is shrouded in great nbseurity, points, like their language, to their eastern origin, and was based upor Asiatic myths of the creation of the worl, and the existwhee of gols havigg the forms and attributes of a perfect hamanity. Their conceptions of these msthical beings were montitied ly the local colouring which they received from association with urw secaes, and through the lanse of time; and hence the different tribes had all their special gods or demirrods, who were often their own lealers or chiefs, to whom the attributes of the gol to whose worship they were most partial were ascribed. It is geverally said that the Germans had meither temples nor statues. Joth Ceesar aml Tacitus expressly affim this, lout it cannot be regarled as liturally true, for Tacitus himself mentions a tomple of a goddess Tanfana among the Marsians; and at a later periol, we tind Christian missionarics exhortimg the Germans to chaoge their prugan temples jato Christian churches, while we also read of the destruction of pagan jims. Newertheless. the religion of the Gurmans was mainly carricl on in the "fen air-in suoves and forests. and on heaths and mountains. Althoush a priestly order also existed mong the Gemans, yet each master of a bumsehold performed religions serviees for limself and lis family within his owa homestean. A kuowledge of the will of the grols and the eronts of the future was songht lo divina. tion from oliservations of the flight of liids, the rushing of waters, and other similar signs, in the interpretation of which women were thought to be especially skillad. Delict in a future life, and in an ahole after death for those who hat cleserved wall in this life, was cherisued anong the formanic races, who had a strong faith in retributive justice, whose sway they belicied would be extrmided over the gods ly inwoing them in a universal ammilating confliet as the prunishment of their cuil deens, after which a new world was to arise guarded by a fure and perfect race of gods. In addition to the higher deities, the Germans peopled every portion of space with a elass of sulurdinate luines who perraled the earth. air, and water, in the shape of ches, nixes, kobolds, dwarfs, and giants; while Nomes and Valkuries stood apart from cither gralle of spiritual existeace as the rejresentatives of lestiny like the Murae and Parce of the Greeks and Romans.-Sec Fuhu, Zur üleston Gésch. d. indogerman. In, he was alpont d in the following year to the command if the whist legions on the lifine. On the teath of Ancustus, in if A. Fi, the soldiers revelted, demami. iny hicher pay, and a shorter 1 erion of service. $G$. hasteneel from Ganl (where be bappenel to be at the time) to remind them of them sluty. The soldicrs, who almest idulised him for his frank and Enentous disposition. urgen him to scize unn the surme power. Gi., homsever, was incapable of treachery and declarel that he wouk rather die than forfeit his allogiance. Ho. however, granter their demands. thongh his colleagne. A. Ciecima, secretly massarded the ringleaders at night. A. now leal the lerims oner the dinine lehw Wescl. attacked the Marsi during a noeturnal festival, ami destroyed their celchated temple of Tanfana. In 15 a. i , he mate a second inruad into tremany. Procediag from Netz into the comentry of the Catti, he destroy their chief town of Natimm (Marlen, 1uar (iulemsherg), slaughtering the entire inhabitants, romg and ehl. On his return, his assistance was implowed ly the anlassalors of Subestes (always a firm ally of the lomans), who was lesinged her his som-in-law, Arminius, the conqueror of Vams. This was at once given, and 'Thusneld., the hornic wife of Arminius, full into the hands of the lomang geveral. Arminins, huning with anger and shame, now ronsed thes Chonsci and all the neighhoring tribes to war. if. in conserquence. commencel at third campaign. Ho dividud bis army into three divisions. The main lanly of the infantry were lal lyy Caciua through the country of the Brncteri, the cavalry under annther wemen marched throush Frioslamb, while G. himself sailel with a Heet through the Zuydersee into the Gernian Gean, and proceden up the river dims, where he joined the ithers. The united divisions now lat waste the conntry in the meighborhond of the 'lentolurg forst. perictrated into its glomy depthe, and gathering ap, the lones of Virus and his legions, Wheth bad latin heaching there for six long years, lowied them with silema funcral honours. If victory gained hy Arminius induced ( f . to make a hasty retreat, durime which he lost part of his tleet in a tempest. Cacina, who retrated by land, sustamed severo losses it the lands of the pursuing (ierruans. Jiefore the tlect of loto vessels, which f . hall luilt in latavia, wis equilyed, he was recalled wer the Jihme in 16 A. D. by news of the beleaguerment of the recently arquired fortress of Alisto on the lippe. The ciemans were repulsal, and the funcral mond in the forest of Tentoburg, which they lad thrown lown, was arain crected. (r. now sailen with his floct asain into the Ems, pressed forwant to, the Weser, which he crosseal, and comfotely reverthew Ammins in two battles. Neverthelesis, he determinel to return, and on his way, arain lost the greater part of his fleet in a great Stum. Is omder t" prevent this event from giving comrate to the ficmans, he once more, in the same 3 car. marched into the country of the Marsi, and despatched his licutenant, Silins, against the Catti.

The victorios thas achieved were to have leem followed "u' in the succeeding years, lint Tiberius, jeatons of his ghory, recalled lim, and feisuing gond-will, bestrwed upon him the honour of a triumb. in which 'Thusnclla appeared among the captives. To rid himself of (i., whose popularity semed to render him dangerous, Tiberius sent him, in $17 \mathrm{~A} . \mathrm{I}$. . with extensive authority, to settle affairs in the last, at the same time apponting l'sen riceroy of suria. whose haughty and despotic Latacter everywhere connteracted the iufluence of Cumaniens. Is. died at Equdabmee, wear Antiokel, ath Detolice, IU A.D., probally of poison. Jle was deculy lamented both ly the inhalitants of the prorinces and the eitizens of liome, whither his ashes were conveyed, and deposited ly his wife Agrippina in the wansolenm of Augustus. Agrippina herself aud two of her sons were put to death, by order of Tiberins; her third sm, Calignla, was spared. Of the three daughters who survivel their fathor, Agrippina hecame as remarkable for lier vices as her mother hau been for hur virtues. Pesiles bis splendid generalslip, $(t$. was conspicums for his wagnanimity, bencrobnce, fincly cultural understanding, and personal purity of life. He wrote several works of a rhetorical character, which bave leen lost: lat of his poetical womks, we persess an epigram, a version of the Plucnomene of Aratus, ant fragments of a work of the same character, entitled Diosemetia, or Prognostica, compiled from Greek somrecs. G.'s literary remains were first puldished at Fologna, in 1474. The latest plition is that of Orelli, at the end of his $1^{\circ}$ hatims (Zurich, 1831).

GERMMNO, SAs, a beantiful and prosperus town of ltaly, is situaten at the base of Monte Casinn, in the province of Terra di Lavoro, abont 50 miles north-north-west of Niaples. It contains handsome pablie edifies, and is surrombed by the rewains of monments and buildings of high antiquarian interest; it is built on the site anl from the rums of the ancient Yolscian town, Casinum, or Casca. The princijal rums of the ancient Volscian periond are a momment, supposed to have been a tomb, an auphitheatre, and a temple. The first is now empleyed as a church; it is a square building, in the form of a Cireets cross, constructed with enormous squard hlocks of stone, on the Cyelopean principle. From its form, it is called the Church of the Crucitix, or Croctisio. The second must have heen in magniticent building, and it is still in a state of preservation sufficient to convey an idea of its oripinal vast proportions. The thirt, adjoining the aminithuatre, was probably built in conjunction with it, at the cost of the Violscian matron, Tmidia Quadratilla, mentioned ly fliny: The fenedictine monastery of Monte ('asmo, at a couple of miles' distance from Sim $G$., is one of the most renowned religious communities of Europe. lts foundation ly Nit Benchet dates from 59 . It contains me of the most heantiful churches of Italy, an extensive library, and a collection of the must jrecions doenments of the midule ages in its valuable archires. The district surromding San G. is highly eultivated, and beautiful. P'op about sou0.

GERMANS, Sr, formerly the seat of the Episcopal government of the ancient diocese of Cornwall, Lucland, now a small village in the conuty of Cornwall. It stands on the slope of a hill, on a branch of the river lywher, $\mathbf{1 0}$ miles above I'lywonth somed, and 21 milus east-south-east of Bodmin. It is notable ouly for its fine parish church, which has an excellent Norman west front, and the towers of which are hung with ivy and fern. Pol. (1S61) 2527 .

GERMANTOWN, formerly a post-borongh of North America, in the state of Pennsylvania, about
.

## GERMINY.

6 miles north-north-west of Philadeluhia, within the clarterel limits of which city it was included in 1851. See article Ihalabehiphis.

GRRMANY, from Lat. Gommente (q.v.), is the English name of the country which the uatives call Jehtschland, and the French L'dllemarne. Sue Abemasis. The word is sometimes nsed to danoto the whole area of the Emopuan continent within Whish the (iermanic race and languate are dmmant, In this Lromb sense, it includes, limiles Germany l'roper, parts of Austria, switzerlaml, ant perhays wen of the Netherlands: lont in the present artiele the name is to be understood as demoting the existins (irmmanic Empire, of whieh D'russia is the head. (b. ocelpies the central portions of Enrope and
 to $55^{\circ} 90^{\circ} \mathrm{N}$. lat. It is bounded on the N. hy the (German Oceau, the Hanish l'eniusula, ame the baltic; on the l. by linssia and Austria; on thes by Anstria, Italy, and switzerland; aml un the W. by lirance, lielgium, and the Notherlamls. The prabation ( $15-1$ ) is abont $41,000,0,0$. Its area is intimatel at cossore square males, or alout inth of that of all Europe. 'The cunst-line neasures about 950 miles. ( 8 , is compored of an ageregation of ditiopent states ( $\because 6$ it mumber), which, as they are slucially treated of under their respuctive heads, will only he noticed in the present article in as far as they severally form parts of the present Gernanic Empire.
The fullowing list givez the mames of these states. with the number of members representing each in the Bundesrath or Federal Council, aml the licichstag or Imperial Dict. 'The Populatious and areas of the states will be fomm under Ferome gememally, and under the head of each spocially.

Bosiles the alowe political divisions, there are ecrtain distinctive aphodations appled todiflerent garts of (t., which have been derived either from the names and settlements of the auciont Gormanic trilna, or fron the circles and other oreat subdrision of the chl empire. Chus the name of 'Swalna' is still appli+d in common parlance to the districts cmbracinis the greater part of Wurtemlerss Southeru Baden, South-western bavaria, and Hobenzollern; 'Franconia,' to the Maine distriets of Bamberg, Schweinfurt, and Wurzburg; 'the Palatinate.' to thenish Bavaria aud the north of Badeu: 'the Ihineland,' to portions of Baden, lihenish Prussia, Bavaria, Hesse-Darmstalt, and Nassau; 'Voigtland,' to the high ground between

IIof and I'lan'ly; "Thuriagia," to the districts lying betwen the 'ller sala and the Werra, as sixaWeimar, \&e, : "lunsatia?', the east ra part of Saxony; "Bast Fricalan,", to the cenntry lotween the dumer Wesor amb Eins; and - Westphalia,' to the district extending leewn lower saxmy, the Netherlands, Thuringia, and llesso, to the German Owan.
finu-fifths of the pmplation of this comitry are of the race called in Liaghish dicmans, in lranch Allemands, lint by the pern themselves Ientsche. The term 1 eutsch, in toothie thimitink, in 0. I1. ther. diutise (batimses ints therfinans), is memiven from the Cothie sulnstantive thimbo, furable, and therefore meant rrizinally the pambar limatan, or, in the math of the leamel, the valazer toman,
 into then acepperl dexignation hath of this wilespreal tonene and of the race that spank it.

The Almmath de Ciuther for $150: 3$ divides the 1rypulation of the Gematu cmpare, in resemp to

 these must be included hali a millinn of lews The (iemams minit of beins mivided into lligh and Low dicmans; the fhasmbly of the former is the enltivated lamenage of afl the derman states; that of the latter, hmown as Plenf-Dentsoh, is spoken in the north and morth-west. The Pules aro fonusel exclusively in the east and north-east of 1russia; the Cachs, in silesia, about U1"phen and lireslau; the Wends, in silesia, lymumhury and l'russian Lissitia; the Lithmanians and Comlanders, in East l'msoin; the I anes, in Slesvis, the W'alhmens, about Aix-la-Chumelle, in lihenish l'mesia; and the French, fartly in the sane re fion, and partly in the newly re-acyuided porinces of Alsace and Lomane. Although the Jews are scattered ower esery part of Germany, they are most unmerous in the l'rusian territuries.

I'hysal Cheracter.-(i. Jresents two very distinct bhysical fermations. 1, A range of hich table damb, becupying the centre and southern pats of the conntry, interspersed with wumerons ranses and gromes of monitains, the most important of which are the Hare and Teutolurserwahl, in the morth ; the Tannes and Thuringerwadd, in the midule; and the Schwarzwad and liauhe Alpa ia the sinthe; and containins an area, including Alsace and demraine, of 110,001 square miles. $\because$. A vast sthely Jain, which extends from the centre of the empire inerth to the German Ocean, and ineluding blesvig. Holstein, contains an area of abont 9 , oin sypare miles. 'This great phain, stretching from the lus-ian irontice on the east to the Netberlanis on the west, is variod hy two terrace-like elewations. The une stretehes from the Vistula into Mecklemburs, at no great alistance from the cuast of the lailtic, ann has a mean elevation of 500 to coo fect, risis! in one point uear I anzig to fovo fent ; the other line "f elevations begins in silesia and terminates in the moorlands of iinnebmr, in I lanover, its conarse being markenl ly sererat summits from 500 to 600 feet in leeght. A larse portion of the flain is necupied by samly tracts interspersen with derwsits of peat: but other parts are moderately fertile, and admit of suceessful eultivation.

In respect of drainage, the surface of C . Lehongs to three ditlerent basins. The Damulse (1. 5.) from its somece in the schwarzwald to the liorders of Austria belongs to (i., and throngh this chanacl the waters of the greatur part of Bavaria are poured intu the 1back sea; thus opening up, commmication with the east. By far the greater paut of
the surface, however (about $155,000 \mathrm{sq} . \mathrm{m}$. ), las a northirn slope, and belongs partly to the basin of the forth sea, and partly to the basin of the Ibltic. the elaive Cerman streams thowing into the Donth sea aro the Ithine (ig. v.), the W (ser (o. v.), and the lithe (1f. $\%$ ) ; into the Faltie, the Other (1.v.) aml tla Vistnla (II. V.).
'The most importint of the mamerons canals which comnect towether the great river systems of (i. ate Lutwig's C'anal in Basaria, which anites the Dambe and Jlaine, and thms opuns a commmnica. tion letween tho lilick sear and Germam Ueean; the finow and liwicdrieh-Wilhelm's eanals in Lrandenburs; the I'lane ('anal, whing eonnects the lihe and the 1lwel; and the Kiel and Eyder 'imal, mitine the Baltic and dicrman Ocean. Numerous lakes neemr loth in the talle-land of Sonthern $\mathrm{F}_{\mathrm{r}}$. amd in the low lamds of the northern districts, lout fow of them are of any meat size. $G$. alounds in swamps and marsh-lands, which are especially numerous in the low northern districts. Its mineral sprinus oceur primeipally in Nassan, Wiirtemberg, lialen, Bavaria, and Fhenish Prussia. Many of these surinos have retained their high reputation from tho earliest ares.
Giologn-The treat plain of North Germany consists of strata if the same are as the Turtiary strata of the laris basin, coverell with very reent saul and mut. Newer Tertiary beds oecupy the river hasin of the Fibine anth from Mayence: they consist of fine light-coloured loan, and contain the hones of the mammoth, rhinoceros, and other contempraneons mammals. Erraties are seattered over the north of dermang. The whole distriet in the centre of Cermany, from the Danme northwarls to Hanover emsists of Secomlary strata. The recks of the Trias perion are hest known in Germans; the typieal rocks of hunter sandstein, muschel-kalk, and kenper being developed here, so as to justify the suitableness if the name Trias, which is wholly inapplicable in Britain, where the series is relresented by sandstune beds only. The Trias is liyhly fossiliferous, abounding espectially in marine shells, ind containing seseral genera of remarkable lahyrinthodont sanrians. Jurassic rocks oecur in Central Germany; at Hanover they consist of clays and marl, with heds of sandstome and limestone, coutaining conal and ironstone of such value that they lave been extensively wrow hit. The Gretaccons strata are frequently higtly altered from the intrulen igneous roeks, which have raised the heds in some distriets to a nearly vertieal masition, and have altered them iuto erystalline marbles and silicious simattones.

Of the Palaozoie rocks, the carboniferons strata are nearly absent in Germany. The coal oltanined in the country is froun rocks of a later age. True twal-beds are foum in Rhenish lyussia. The sedimentary roks of the Harz Mountains are chictly Devmian: to the south-enst, near Herzerone, they are Uther silurinu. They are all greatly dislacited by sranite and other intrusive rweks. The 1 larz llountains are surrounded ly a zone of Permian rocks. The stratifiel rocks of the Thuringerwall are also Deronian, resting on Lower sihurian strata, the lower portion of which is highly altered into quartzose schists; the remainder consists of arcywacke, slate, anl sandstone, with limestone and alum slates. There are numerons fuenid and annelid impressions in the older beds, and grajtolites, orthoceratites, aml trilolites in the newer.

The bisaltie rocks, trachytes, and other voleanic froducts are largely devel ped in the Wifel, Siebentelimge, Westerwald, Vorels, Fhögelinge, and other momatain systems of Central Germany:

C'limutc.-The climate of G . presents less diversity
than a first glance at the map might lead oue to infer, for the greater heats of the more sunthern latitules are considerably molified by the hilly character of the conntry in those parallels, while the eqh of the northera phains is mitigatel ly their sicinity to the oecan. The arerage decrease in the mean temperature is, iu suing from south to north, alout $1^{\circ} \mathrm{F}$. for every $\mathrm{a}^{2}$ miles; and in ging from west to east. abont $\mathrm{l}^{\circ} \mathrm{F}$. fur every $\mathrm{T}_{2}$ miles. The line of perpectual sunw varies from 5200 to 8000 feet above the level of the sea. The mean anomal fall of rain is 20 inches. The fullowing table shews the mean ammal recorls of the temperature at different loints of the coutincat:

|  | Nean Ar. 1- Hill | Summet. | Winter. |
| :---: | :---: | :---: | :---: |
| Hambarg, | $4{ }^{\circ} \mathrm{Fah}$. | 6f fill. | $30^{\circ} \mathrm{F}$, |

| Frankfurt-ou-the-saine, | 48.5 |  | 31 |
| berlin, | $45 \cdot 5$ | 15 | 27 |
| Il inuser, | $43^{\circ}$ | 13 | 33 |
| §ünirsbere, * . | 4\%* | 62 | -1 |

Prolucts.-Ct. is rich in anineral products, ammong which the must impontant are silver, found in the 1Iazz Monutains; irun in numerons montain-ranges; salt in many parts of the country ; conl in Thenish l'russia and silesia. Cobalt, ansenic, sulphur, saltnetre, alum, gyismu, Jisunth, pumiee-stone, tripolislate, kalin, cuers, ocher, and vitrich, are all among the exports of Cermany. The vegetable products comprise a rery large propartion of the European flura. All the ondinary cereals are extensively cultivated in the north, and largely exported, chiefly from Wurtemberg and Bavain; hemp and Hax, mader, woul, and salfrou, grow well in the central districts, where the vine the cultiration of which extents in suitable luealities as far north as $51^{\circ}$, is brought th great peffection-the lest wine-prohacing districts luens the valleys of the Danabe, Fhince, Naine, Neckar, and Moselle, which are, moreorer, gencrally notel for the excllence of thair fruits and Vegetalifes. Tolnace is grown in sufficient quantitics fur extensive caportation on the Ulyer Rhiur, the Werra, and Oder. The hups of Bavaria have a high repmatain, and the chicory grown in that conntry: and in the district hetween the Elbe and Wiser: tinls its way all uver Eurore as a substitute for coflive. The most extensive forests are found in Central G., and in some parts of lrussia, while the north-western parts of the great phain are deficient in wool, the phace of which is in some degree supIdied ty the alumiance of turf yiedted by the marshy lanis. G. has lome heen noted for the gool lreed of horses raised in the northern parts of the contineat: while saxony, silesia, and hrandenbury have an equal repratation for their shecp-flocks, and the tine quality of the woul which they yich. The rich alluvial thats of Mecklenburg and Hanover are celemated for their cattle; the forests of Nouthem and Central th abound in swine, and in small game of ratious kinds; while the Bavarian $1 l_{1}$ s allort shelter to the larger animals, as the chammis, the reld deer and will-goat, the fox, marten, and woff; and in all the plains in the north, sturks, wili-gcese, and dueks are almondant. Among the lishes of $\mathrm{G}_{\mathrm{c}}$, the most generally distributed are carl, salmon, trout, and eels; the rivers contain also cray-fish, pearl-bearing mussels, and leches. The oyster, herrinis, and col tisheries constitute important branches of industry on the German shores of the Baltic and Nortla Sea. (G. stimels next to Great Britain in regarid to the eare and success with which its arrienltura, miniug, and other natural caprablities have loen cultivated. All the German states cuenurage agreulture, and have cnileavoured. hy the establishment of agricultural colleres and exhibitions, to diffuse among the people a knowledge
of recent scientifie appliances. The countries which have become most couspicuous in this movement are Prussia, Bhwaria, and Saxony. The preservation and cultiration of woods receive almost as much attention in ( 8 . as agriculture, and like the latter, are elenated to the rank of a seicnec. The larger woods and forests in most of the states beloug to the govemment, and are unler the' care of spectal bords of mantgement, which exercise the right of sumprision and control over all forcst lands, whether bulbic or private.

Manufuctures.-The ollest and most important of the (ierman industrial arts are the mandiactures of linen and woollen gools. The chief locatities for the cultivation and preparation of tlax, and the weaving of linen fabrics, are the mountain-valleys of Silesia, lusatia, Westphalia, the Marz, and Saxony (for thread-laces) ; while cotton fabrics are principally made in flhenish I'russia and saxony. 'The same districts, together with l'omeradia and Bavaria, manfacture the choicest wollen falries, including damasks and carpets. Toys, wooden clocks, and wool-carvings, which may be regarded as almost a speciality of German inlustry, are carried to the greatest porfection in the hilly districts of Saxony, Bayaria, and the Black Furest. The best irm and steel manufactures beloug to Silesia, Hanover, and Saxony. Silesia probably bossesses the finest glass-manufactories; while Saxony and Prussia stand preeminent for the excellence of their chima and earthen wares. Augs. Lomry and Niirnberg dispute with Munich ant Berlin the title to pre-eminence in silver, gold, and jewellery work, and in the manufacture of pimiosophical and musical instrments; while Leipsic and Munch claim the first rank for type-foundries, priating, and lithogralhy. The tralling cities of Northern (i. nearly monopolise the entire business connected with the preparation of tobaces, snuff, \&e., the distillation of brandies, and the manufacture of sugar from the beet, :patato, and other roots; while vinegar and oils are prepared almost exclusively in Central and Sonthern (iermany.

Reileayg, do-The railways which intersect each other in all directions, from Basle on the Phine to Hadcrsleben in the north of Slesvig, and from Bantzen in tho cast of sixxony to Aix-la-Chapelle in the west of Jhenish I'russia, measured, in 1571 , ahont 13,130 Euglish miles; but these figures strietly represent the length, not of the lines within the limits of the German empire, lut of those which are unter Cerman alministration, though extending some way into neighbouring states.

The various telegraphic hines of the empire ( ex eppting those of Bavaria and Wurtenherg) are now mader is central administration, and in 1571, the whole measured nearly 20.130 English miles.

The postal system of the German states, which is administered ly Boards of Control, includes the expadition of passeagers and gools by the postcarriages of the several departments. Since 1S51, in accordance with a treaty eonchaded between Austria and Prussia, a Crermano-Austrian lostal union has been establishel, the objects of which are to secure an elfeetive and more encrgetic administration of the various branches of the organisation, aul the adoption of a uniform scale uf charges, while it likewise exercises the duty of concluding international postal treaties with foreign states. Bavaria and Wurtemberg lase still their special postal administrations.
The multiplicity of small states, into which the German land was lone broken up, opposed great obstacles th the development of commerce; lont the difficulty has to some extent been obviated by the establishment of the Zoll und IIcndels-verim
(1]. ..), or 'Customs and Trale Confederation,' anel partly also by the alsorption of several of the swaller states by l'russia.

Eilucation.-Elucation is more generally diffused in ( $\%$. than in any wther country of Lurope, and is enltivated with an carnest and systematic devotion not met with, to an equal extent, among other nations. There are 21 universities: Berlin, Ereslau, Halle, Bonu, Greifswald, Munster, Munieh, Wiirz. Murg, Erlangen, Leipsic, Tulbugen, Guttingen, Heilelberg, Froburg, Marburg. Giessen, Jemi, Iostock, Kicl, Kinigsbers, anl Strasburg. These institutions cmbrace the four facultics of Theology, Law, Medicine, and I'hilosophy: aud in June 1s7\%, hand 1154 professors and teaders, and 13,990 students. Of the 21 universitios of the empire, 1 .t are Protestant, i. e., in the department of theology, they teach only protestant theology; four are Loman Catholie, viz., Freiburg, Munich, Munster, and Wrirzburg; three. viz, Bonn, lireslan, and Tubingen, are mixer, Protestantisne prevailing in the first two, and Roman Catholicism in the last. There are also 16 polytechmic institutions; about 500 high schools of gymoasia; numerons surecial schools of technology, agreulture, commerce, inilitary seience, \&c.; several semmaries for teachers, and for the ministers of different religious denominations; and mote than 50.1000 elementary schools. The attendanee of clildren at school, fur at least four or tive years, is made compulsory in nearly all the German states, ant hence the froportion of persons who cannet read and write is exceedingly small in Germany.

Publie libraries-of which there are more than 150-museums, butanical gardens, art-collections, picture-galleries, sehools of music and design, and acalemies of arts and seiences, are to be met with in most of the capitals, anil im many of the country towns, upwards of 200 of which possess one or more permanently established theatres. In no country is the book and publishing trate more universally patronised than in Germany. The press anmally sends forth from 8000 to $\$ 0,000$ works, while alout 3000 papers and journals are circulated throughout the empire; of the current newspapers, a comparatively small number only exert any markal inlluence, but many of the Cerman scientific amb literary periodicals anjoy a worke-wide reputation. The censorship of the press was abolished by is decree of the diet of 1515 , an! fredom of the press, under certain restrictions, which were promalgated in 1554, has been introduced.

Army aned Nievy-1. Army- - Dy the constitution of April 16, 157, the Prussian obligation to serve in the army is cxtended to the whole empire; article 50 preseribes that every Cerman who is arthrühiy, i. e., 'caprble of bearing arms,' must be in the standing army from his twenty-tirst to his twenty-eighth year. Of these seren yours, three minst be spent in active service (bri den Fuhnen), and the remainter in the army uf reserve. On quitting the army of reserve, he has to form part of the Landuchr (q. v.) for other five years. Article C. 3 cnacts that die $\mathrm{g}^{\prime}$ sammes Landmutht des heirhs wive rin cinheitliches Meer biden, weldes im Krimg nuet Frioden unter elom Befthle des Kaisers steht ('the whole land-fores of the empire shall form a moited amy, in war and peace, under the command of the emperor'). 'The sovercigns of the principa! states have the right to select the lower grades of officers, but even their selections require to obtain the afyrowl of the emperor, whose authority is faramont; artiele bit expressly declaring that alle deutschon Truppen sind everpitichtet den Defohen des Kaiscrs undelingt Folye zu teisten ('all Guman troops are bound to obey unconditionably the orelers

 (4. ©.) on the Baltio, and Wilhelmshaven (o.v.) in the liay of Juhnle on the Nurth sea.
he lifien.-In resard to religion, it may be stated gencrally that lrotestantism pretominates in the inorth, and laman 'athulicism in the sonth, althongh vary few states (whibit exchavively either form of faith.

The following is the proportion of the different Ahominations, woorling to the census of December 1871: 1'rotestants (Lutheran and Calvinist), $25,5010,000$; Joman Catholies, $15,000,000$; various small Christian sects. as Homeahoters, Memonites, EC. 110,010; Jews, tit,000.

Polifical Wimmismfion.-All the states of the empire recognise fonr distinct orders-viz, the mobility, elergy, hurghers, anl peasantry, and all distimenish three ilistinct grades of nolility. The hichest of these inchules the members of reigning lonises, and the descendants of families who belonged at the time of the ohl ampire to the soverigu mability of the state, amel were rechanemmith har, or dircetly comncted with the empire, as holling their immains directly under the emperor, lout whose homses havesubsumently been melutised, or deprived of sorereign ${ }^{\text {mowe }}$ in accordance with special treaties betwen the state and the princes. There are at preSent Fi princely and is mrielliche (er untly) merliatised fomilisz, who, in accorlonce with the act of the diet of 1 sub, have eruality of rank with reiguing houses, and enjoy many of the special privileges which wew accouded to the hierle mobles of the empire. The secoml grale of nobihty is composed of counts and barons not ledongiag to reigning or mediatised huses, whilst the third and lowest grade includes the knights and hereditary matrimonial proprictors of licmany.
13.fne we procen to consider the political organisation of the: now themanic empire, we will brietly Werribe-1st, the mincipal features of the constituthon of the wh ficmanic empire, which was overthruwn ly the First Napumon in 1806 ; amed 20 , that
 t" lati, when Austria was excluded from the Confeleration, and the hegenony of Germany was transervel to Irussia.

The whe Ciernmic Donpire.-The states of this empre cumanisal the chamburs or colleges: 1 . The Electnall College, which consisted of the arehi-
episcopal electors of Manz, Treves, and Colurne: and the secular electors, of whom there were arisin. ally only four, but whose numiner was subsenpuntly increased to five and who at the elissolution of the empire were represented loy the sovereighs of Bohemia, Pavaria, saxomy, Bramlenhoum, not Brnus-wick-Lüneburg or Hanner (see Etectoss). ㄹ. The College of the Princes of the Empire, who hat each a vote in the diet, and were divided into spiritnal and temporal uninces. 3. The Free Imperial Cities which forned a coflege at the diet, divided into two benches, the Fhenish with 14 cities, and the Swabian with 37 ; cach of which had a vote. These colleges, each of which voted separately, formed the diet of the empire. When their respective deeisions agreed, the matter under discussion was submitted to the cimperot, who could refuse lis ratification of the decisions of the diet, althnugh he had no power to modify them. Ordinary meetines were usually sum. moned twice a year ly the cmperor, who sleceifen the place at which the sittings were to be leld, and which, during the latter prionds of the empire, were at liegenshug (liatishon). The diet had the right to enact, abrogate, or modify laws, conclude peace and declare war, and impose taxes for the general expunses of the state. The Aulic Chanber, and the Cameral or chief tribnaal of the empire, decided in eases of dispute hetween members of the diet. The emperors were ehosen by the electors in person or by their deputies; anl after theri election and coronation, which usually hoth took place at lirank-furt-on-the-Maine, the emperor swore to the 'eapita. lation' or constitution of the empire. After the dissolution of the empire in 1806 , its phace was nominally tilken by the Confederation of the lhine, which owed its existence to Napoleon, and which lasted till 1815.

Late Germatic: Contudtation.--'1he late Germanic Conferleration was established hy an act of the congress of Viena in 1515 , on the overthrow of Napoleon. It was an indissoluble union, from which no single state comble at its own leasure retire. Its central pint mits executive and legislative powers were repesented by the federative liet, which held its meetings at Frankfnet-on-theMaine, and was eomposted of delegates from all the confederate states, chosen, not by the people, but by the varions govermments. The diet dehberated either in a limitel couneil (the Ferlerative government) or as a gencral assembly (Plemem). In the limited council there were 17 rotes, of which 11 of the principal states had cacl at single rote, while the reminining states diviled the six eollective votes between them. The l'leunm, which met ouly when any orsanic change was to be cfliected in the dict itself, embraced 70 votes, of which Austria and the five Curman kingloms hat eaw four, while the other states ham 3,2 , or 1 vote each in poportion to their imdividual importance. It resten with the limitel commeil, which executed the enactments of the l'lenm, and despatched the ordinary business of the Confederation, to decide (by a majority of viless) whether a question should be submitted to the Plenum, where it was not debaten, but simply decided by a majority of ayes or noes. Austria presided in both assemblies, and hat a casting voice in cases of erquality. The diet, as a collective borly, had the right of concluding peace and alliances, and declaring war ; but this power couln ouly be exercised for the maintenance of the indelendence and external security of 4 ., and the individual integrity of the several federative states, which on their part were bound to submit to the dict the consideration of all guestions in dispute between themselves and other powers. Where sucls elifferences could not be settled by the committec empowered loy the Plenum $7: 1$
to consider them. they were fimally referreal to a special tribumal known as the ' 'Alistragal' Court, which was composed of several members of the Confuleration invested for the time with full powers. S. ${ }^{\prime \prime}$ formunt Limpire. Tho seventy-ninth article rf the ennstitution of the Num (inmim 'omfereration provicer for the ahmission of the Serath Cere man states into the new liand; and the war hetween France and Germany, which broke out in Jnly 15\%., and in which all the German priners aml periles took part, gase an irresistible impestus to the desire for nationsl unity: On the lath November 1sio, the erand-duchies of foubem amd thesse joined the Jund: Bayaria followed on the esh, and Wiartembers on the esth of the same month. Fiurtly after, the king of Bavaria wrote a letter $t$, the king of l'russia, urying him to re-establish the Cerman empire. This lrwaght the question ander the notice of the Thum ; amd on the loth Wecember 1900 it was agreal, by is rotes to 6 . that the empre should be restored, and that the liner of l'russia should be ackaraledgel hereditary emporor of Termany. The latter sulembly accertent the new dignity at Versalles, 1sth January 1s:I.
The new empire is cimposid, like the wh Bund, of a confederation of Gumam states; but these are welled into one for national purpuses as was never hefore the case; and the imperial 1 wer, by the terms of the constitution, is so fuly assurted, that it canont possibly be assailen "r puestimed from within. There are two legislative borlies in the empire-the Brandoweth, or Federal Council, the members of which are annually apmontel loy the governments of the various states: and the thichostad. the menbers of which are clected ly universal sulfrage and loalhot for a periml of three years. All imperial laws must receive the votes of an absulute majority uf both bodies, anl, to be valiu, must, in addition, have the assent of the emperor, and he conatersismed when promulgated by the Rifho Roneler, or chancellor of the empire, who is ce offe president of the Bundesath.

Acending to the eleventlu article of the constitution, the German emprer, with the consent of the Bumdesrath, can declare war, make peace, enter into treaties with foreign mations, and alpunt and rective ambassadors. If. however, the territory of the empire is attacked be dues not require the consent of the bundesiath to declare war, hut can act indenembently:
The $1^{\text {wower exereisel }}$ by the empire extends to everythin necesary to the secmity and welfare of the German people. 'The preamble to the constitntinn expressly declares that all the states of Ger-

 Dentechen Jolds form an eternal uninin for the protection of the territiry of the Bund, and fir the care of the weltare of the (s, rman p"ople'). Thas, it $l^{\prime \prime *}$ sesses the exchusive right of le islation on all military and naval affairs: in imprial tinance amd commerce: on pusts. telemraphs, amd ralways in so fir as the interests of the nitional bitume are concerned. Wherever the liaws of the empire cone into collision with thuse of prarticular states of the Brand, the latter must be hed as abrogated, and in aid di-putes that arise amoner the latter, the imperial jurisiliction is supreme anil timal.

Acting unter the direction of the chancellor of the empre, the Lumderath, in addition to its legislative functions, represunts also a supreme alministrative and consultative board, and as such, has
seven standing committees-namely, for army and naval matters; taroll, excise, and taxes; trade and
 and (rimmal law; finameial acemots; and forejen affairs. Fidh committece coosists of representatives of at lewht four states of the empire; lout the foreinn allairs connmitte inclates only the ratesentatives of thee kimetoms of l'russia, liataria, Saxiny. amd Wurtemberes.

It this prion, there were in Cermany live mations-the Franks, saxons, bavarians, swabians, and Lumainers. 'The Franks, as the descendants of those who had conpreved the land and fondel the cmpire, cujoyed a premenmence wer the uthers: and hence, on the extinction of the Carlovingian race, the chave of the princemectors seems to have fallen almost as :t matter of enurse on the chief of the franks, the lake or l'onnt of Franconia, who reigned is kinis of Cermany from 211 to 11 S , umder the tith of Conrad I. It his own instigation, his rival and adrersary. Henry, Duke of saxony, was chosen as his successor, and proved himself" ial able and warlike prince. The conquests which le gainel over the Dimes, slaves, and Magyars were confirmerl and extemted by his suin and suceessor,
20

Otho I. (936-973), who carried the boundaries of the cmpire beyond the Elhe and Saale, aml who, ly his acquisition of Lombardy, laid the foundation of the relations which existed for many ages lntwen the rulers of Gormany and the Italian nation. Otho's coronation-festival was eventful, as it formel the precedent for the exereise of those afliees which, till the dissolutim of the empire, were regarche as connected with the dignity of the sceular electors. for on that riceasion, while the cmperor dined with his three spiritual electors, he Was waited upm by the secular prinees-the Electur of Bavaria (afterwards saxmy) serving as grambmarshal: of Swabia (afterwarls Bohemia), as grand-cmbearer ; and of homaine fafterwarls Imandenhurg), as arch-chamberlain.

Otho 11. (178-983), Utho 111. (983-1002), and Ifemry II. (1002-1024), belonged to the Itonse of Saxony, which was succeeded by that of Franconia, in the person of Conrad II. ( $1028-1039$ ), an ahle ruler, who added burgundy to the empire. His son and successur, Henry 111. ( 1039 - 1056 ), extended German supremacy over Hungary, part of which he conpured and amexed to Lower Anstria, while he repressed the insolence awh despotism of the temporal and spritual princes of Cermany, and gained the respect of his contempuraries by his zeal for justice and his valour in the fichl. The minority if his son and snccessor, Henry iV. (1056-1106), enabled the nobles to recover mueh of their former power, and to aftly a check to the further consolidation of the imperial authority, which hat been comsilerably extenten nuter the two preceding reigns. H'ury's constant guarrels with the astute liregory YIh. entangled him in ditticulties and mortifications which only ended with his life, and which phumend Cremany into anarelyy and disorder, amd entailul uron the empire destructive wars which convolsed the whole of continental Furope for more than two centuries. With his son and successor, llenry V. (1106-1125), the male line of the Francomian dynasty leeame extinct; and after the crown had been worn (11:5-113S) by Lothaire of Saxony, who made a bold attempt to recover some of the prerogatives of which at his clection the cmpire hat been deprived through papal intrigues, the choice of the electors, after a season of dissension and intrigne, fell mon Conrad IH., Duke of Franconia, the first of the Hohenstanfen dynasty (1138--1152). Itis reign, in which the eivil wars of the Gnelphes ame Ghibellines began, was listracted ly the dissensions of the great fembatories of the empire, while the strength of Germany was wasted in the disastrous Crusades, in which Comral took an active part. On his leath, the clectoral college for the first time met at Frankfurt, whid retained the honour of being the phace at which the sovereign was elected and crowned till the dissolution of the empire in the 1!th century. Frederick 1. (1152-11!6), surnamed Barbarossa, Duke of Swabia, was, at the recommendation of his nnele Conral, chosen as his suceessor, and the sulembur of his reign fully warranted the selection. By the furce of his character, Frederick acpuired an inthence over the diets which hau not been possessed by any of his immediate predecessors, and duming his reign many important changes were effected in the mutual relations of the great duchies and comuties of ficmany, while we now for the tirst time lear of the hevelitary riglit possessed hy certain princes to exercise the privilege of clection. Unfortumately for Cermany, this great monarch sufferel the interests of his Italian deminions to draw him away from those of his own conntry, whilst his particimatina in the Crusales, in which both he and the thower of his chivalry perished, was only memoratle
for tho misfortunes which it entailed on the empire. The interval between the death of Frederick Parbarossa ( 1190 ) and the accession of findolf I. ( 1073 ), the tirst of the Hapsburg line, which, through a female branch, still reigns in Anstria, was one of constant struggle, internal dissension, and forcign wars. Individually, the minces of the Hohenstanlien dymasty were popular monarehs, their many noble and chivatrous qualitics having endeared them to the people, whide one of the race, Frederick II. (1212-1250), was, after Charlemagne, perlapis the must remarkalle subereign of the middle ages; but their ambitions designs on Italy, and their constant lat futile attempts to destroy the paral power, were a scurce of misery to Germany, and with Frederick 11. ented the glory of the empire, till it was partially revived by the Austrian House of Halso hurg. His son, Comrad 1Y. (1250-1254), after a brief and troubled reign, was suceeded by various princes, who, in turn, or in some cases contemporaneonsly, bore the imperial title without exercising its legitimate functions or authority. This season of anarehy was terminated at the accession of liudolf I. ( $1273-1091$ ), who, by the destruction of the strongholds of the nobles, and the stringent enforcement of the laws, restored order. His chief alforts were, however, directed to the aggrandisement of lis Anstrian possessions, which embraced Styria, Carinthia, Camiola, and Tyrol.

For the next 200 years, the history of the German empire presents very fow features of interest, and may be hriefly passed over. Adlolf of Nassau, who was electerl to succeed liudolf, was compelled in 1298 to yiehl the crown to the son of the latter, Albrecht 1. (1098-1308), whose reign is chielly nemonable as the period in which three Swiss cantons, Unterwalden, Schwytz, and Uri, established their independence. After the murder of Albrecht, the throne was ocenpied in rapiel suceession by Heury V11. (1308-1313), who added Bohemia to the empire ; and conjointly by Frederick of Anstria and Lindwig of Lavaria ( $1313-1349$ ). Charles 1V. ( $18.49-1378$ ) of Linembourg was the snceessful candidate among many rivals, and although he attented specially to the interests of his hereditary possessions of Bohemia, Moravia, Silesia, and Lusatia, he did not entarely neglect those of the empire, for which he provided lyy a written compact, knows as the Golden Bull, which regulated the rights, privileges, and duties of the clectors, the mode of the election and coronation of the emperors, the coinage, customs, and commercial treaties of the cmpire, and the rights and obligations of the free cities. His son, Wenceslaus ( 1378 - 1400 ), who was finally deposed, bronght the royal muthority into coutempt, from which it was scarcely redeemed by Finprecht of the Palatinate ( $1400-\mathrm{l}+10$ ). The nominal reign of Sigismund ( $1410-1437$ ), the brother of VFenceslaus, wund demand 110 notice were it not for his convection with the Councils of C'onstance and Basel, at the former of which Huss was contemned, and which was followed by the disastrous Hussite wars. The realiness with which Sigismund lent himself to the interests of Heury V. of England, and of all other princes who ministerel to his hove of personal display, brought discredit on the imperial dignity, while his dishonourable desertion of Huss will uver attach imominy to his name. Albrecht II of Austria ( $143 \mathrm{~S}-140$ ), after a brief reign of two years, in which he gave evidence of great eapreity for governing, was succeeded by his cousin, Frederiek 11I. ( $140-1493$ ), an accomplished hat avaricions and indolent prince, whose chief ohject seemed to be the aggrandisement of the House of Austria, with which the title of

## GERMANY.

enajeror haul now lecome permanently connected (see Ar*orran), while be noglected the interests of Germany collectively, and sulfered the intidels t, make mollecked allyances upon its territory. Maximilian I. ( 149 - - 1 :ild), the son and successor of frembrick, resmmbled him in few respects, for lis was actire, ambitious, and soluming, but deficient in sto uliness of purpose. Hlas marriage with Dlary, the rich beiress of hur father, Charles the Bolil of Purgmuly, insatred him in the general prlities of liurale, while his oplosition to the reformed faith freacheal by Luther exasperated the relighoms ditherences which distuber the cose of his rejen. Maximilian Larl, however, the merit of intrulncing many improvenents in recrarl the the internal organisation of the state, by enfureing the leeter administration of the law, establishime a pulice and an organised arms, and introtheing a postal system. With him urisinated, mumenver, the special conrts of juristiction laown ats the "Imperial (hamber" ant the "Aulic C'onneil;" and in bis reign, the empire was divided into ten circles, each muder its herelitary president and its herelitary prince-convoker. Maximilian lived tar see the berquming of the lioformation, and the suceess that atteuled Lathex's preachiner; lout the fimn establishment in Gemmany of the reformen faitls, and the religious dissensions ly which its success was attender belong prinedially $t$, the reien of his gratuon, Charles 1., king uf Smin, the som of the Aredulake Jhilip and uf Jomma, the heiress of spain, who suceceded to the empire under the title $\quad$ ut (harles V. (1519-15.7i). The management of his vast posxessions in spain, ltally, and the Netherlames, and the wars with France, in which he was so long implicated, diverted lim from his German territories, which he eommitted to the care of his brother Ferilinand. The priaces of Germany were thus left to settle their relinions rifferences among themselves, and to quell, umaikal by the head of the state, the formitalbe insurrection of the peasants (1505), which threntenol to malermine the very fomblations of sueiety. This rising of the lower orders was lue to the preaching of the famatic Ninzer, and uther lealens of the sect of Anabaptists, which had arisen from a pervertenl interpretation of some of the tenets alvancul hy Lather. Charles's determined opposition to the reformers rentered all scthement of these religions lifferences impracticable; and althonth, by the adof his ally, Manrice of Saxony, he broke the conferleration of the Protestant princes, known as the Enion of smalkall. he was forced loy his former ally to make concessions to the Lutherans, of which he disapprowed; and in his dixenst at the complicated relations in which the was placed to both parties, he abricated in fiwour of his brother Ferlinami ( $15006-1504$ ), who put in ensi to moch of the religines dissensinn that hat hitherto distractal the ampire, ly grantiner contime tolcration to the Protestants. Althoush l'erdimami was, personally, mald amb lacitic, his reign was trombed by domestic and furcign ageressions-the different scets disturing the Inace of the empir at home, while the Freach and the Turks assaliml it from abrome. Durins the next fifty years, the empire was a frey to internal disupurt. Maximilian 11. (104-1.506) was inllech a wise and just priace, imt the little he was able to effect in reeonciling the alherents of the different churehes, and in raising the charaeter of the imperial rule, was fatally courteracted ly the ligotry and vacillation of his son and sacessor, liutolf 11. . ( $1576-1612$ ), in whose reign (emmany was torn by the dissensions of the uppsite religious factions, while each in turn called in the aid of foreigners to contribute towards the universal anarchy which eulminated in the Thirty

Years' Wrar, hegun under Rhulolf's hrether and successor Mathias ( $1612-1610$ ) ; cont inued und $\cdot$ T Ferdinand 11. (1619-1637), an able, lut crucl amb higotel man; and eaded under Ferdinand 1II. (16.3:-16.7.), Wy the treaty of Wiostphalia, in 1619. The effect of the Thirty Years' War was to depopulate the rural dastricts of diermany, Austroy its commerce, burden the perple with taxes, cripple the alrealy debilitated power of the emperors, and ent up the empire into a multitude of petty states, the rulers of wheh exercised ahost absolute power whin their own territories. Leandal I. (10.5s-17(15), a haughty, pedantic man, the mot avail homseli of the ingmortonitios aflimhed by frace for rosturing orter to the state, luat sutferial himself to be drawn into the coalition aqainst France, whilst his hereditary states were overrun by the 'Tmilis. Althong sucerss often attembed his arms, pace lwough him nos siqual adrantares. The reigns of Joseph 1. (1705-1711) and 6hates II. (1:11-1740), with whom expired tha male line of the Hapsbur: dynaty, were sizalised hy the sreat victories won by the imperialist meneral. Irince Fugene, in comjunction with Marllmshath, aver the livench; but they boonoht nus solul alvantage to the empire. The distrided condition of spain and Saxony upened new chatands for the interfereace of Cemmany, whin was further distracted, after the death of tharlez, hy the hissemsinas weasioned hy the contested suceesinim of his danditer, Maria'I'beresa, amel, throuch her, of her hastrani, trancis 1. of Lomaine ( $174.5-170.0$ ), after their riwal, the Bavarian Elector, Wharles Vil., haw, theong the intervention of l'mussian ad, been dected in 1742 to the imperial throne, which, howeser, he was oblised to celle, after a brief ocomation of three years. Constant disturbaber, intensified dming the seven Years' War, whon Freterick the Grent of Prussia maintained his eharacter of a skilful general at the expense of the Autrians, made the rogn of these sovereigns one of trombe aut disanter. Joselh II. their son ( $\left.1.6 .5-1700^{\prime}\right)$, Aluring the lifetime of Maria'lheresa, who retained her authority over all the Anstrian states, enjoyed little heyom the title of croperan, to which he had snceceded on his father's death. 1hut when he ultimately acquired his mother's valst patrimony, he at once entered uron a course of riorms, which were, howerer, prematnre and unsuitel to the cases to which they were aphind: whilat his attempets to reestablish the supromacy of the imperial $1^{\text {nower }}$ in the sonth of Cemany were frustrated log I'russian infuence. Lonpldill, atter a short reifo of two years, was succeded in 170. hy his som, Francis 1I., who, after a series of defeats low armies of the lrench repuitic, and the athesion. in 1sto. uf many of the derman prines to the allitwee of Frater, which led to the sulserpent formation of the I'henish Confederation nuler the protectorate of Napoleon, resimed the derman crown, and assumed the title of Emperw of Anstria. From this luriol till the Congress of Viuman if 1814-1815. Germany was almost entirely at the merey of Sandeon, who deposed the established sovereinn* and dismembered their states in favom of his favourites and dependants, while he crippleal the trade of the comitry, and exhausted its resources by the extortion if subsilites or contributions. As a reconstruction of the ohk empire was no longer possible. thuse states which still maintained their sovereignty combined, in 1815 , to form a tierman Confederation. Of the 31010 states into which the empire hal ance been livided, there now remained only 40 , a number which has since been reduced to $3 J$ by the extinction of several petty dynas. ties. The dict was now reorganised, and apointed
to hold its mectines at Frankfurt-on-the-Nlame. attur having beon formaly recognised hy all the allied states as the lughative and execntive nrean of the Confelleration ; lut it faileol to satisfy the 'xpectations of the mation, and soon becme a mere palitical toon in the liands of the prinees. whan simply made its decress suluservint to then own edforts for the suppession of every progressive monement. The Frenth revalution of 1830 reate sutficiently on some fow of the German states to compel their rulers to graut written constitutions to thoir subjents: lat the cffect was transient; and it was not till 1849 that the (temman nation save expursion, ly upen insurectionary moroments, to the discomitent and the sense of "中mpession which hat long pussessel the minds of the people. The priners thenemourch, by lasty concessions, to arest the promess of repuldican minciples, and, fully reeognising the medfieiency of the duet, they cave their sanction to the convoeation, ly a provisional self-constituten assembly, of a national congress of representatives of the pernle. Archaluke John of Anstria was clecten Viear of the newly orranised national government; lat he som disalprointed the hares of the assembly ly his evilent atteripets to fristrate all enersetie action on the side of the parliment, while the peedy success of the anti-renublican party in Austria and Drussia damped the hopes of the progressionists. The refusal of the ling of Pressiat to aceept the imperial crown which the parliament offered him, was followed ly the dection of a provisional regency of the empire : but as nearly half the members had theclined taking part in these proceelings, or in a previons measure, by whieh instria had been excludel, liy a single vote, from the "erman ('onfenderation, the arsemhly som lapsed into a state of anarely am imponence, which terminated in its dissolution. The vangumary mamer in which insmrectionary movements hal, in the manwhile, hecn suppressed by Prnssian troops both in I'russia and Saxony, pht an effectnal end to repulican demonstrations ; and in 1550, Austria and l'mssia, aftre exhibiting motnal jexlonsy and ill-will, which more than once seemed likely to end in war, comlined to restore the dject. whose first acts were the intervention in Slesvig. Holstein in favar of Hemmark, aul the abolition of the free constitutions of several of the lesser states. Nince that primh, the clict has luen the arema on which Austria and Mrussia have striven to secure the sumemacy and clampiomship, of (tormany, and every measure of pullie interest has bern male suliservient to the views of one or other of these rival powers. These states dirl, lowever, ennclude a treaty of alliance in 185t, suarantecins to exch other the montual deffere of their jussessions against all nemitsat compact in which the diet simen joined. In 1858 , a currency convention was conduded lutwem all the states of the Germon (onfederation, which had previonsly entered into similar allimens for the aljnstment of international postal and commereind relations: ant in the same year the dict alopted a resolution by which the Danish government was catlel nyon to submit to the legiskative assmblies a nuw project for the political organisation of the duchies of Holstein, Lauenburg, and Slesvig. In 1850, after many stomy discussions, the assembly passed a resolition to molvitise the whale felleral army, and to appoint the Prussian frince lexent commander-in-chief, subject to, the control of the diet, or virtually of Anstria, with whith rests the casting-vote in the federal assembly. 'lhis apponintment lin] not satisfy the ambitions views of I'russia, which has, however, abstained. during the last year or two, from making any very
decisive attempt tor secure the surme pritical leadership in (iermany. A strong anti-Nambomie fecling has existed since the first outbreak of difliculties letween France and Anstria; amb it may lee stated generally, that the discussions and aprelensions tio which this schtiment have given rise, thecther with the consilleration of the SlesvigHolstem dithenlties, have constituted the prineipal questions under discussion in the federal parliament during the sessions of 1509, 1860, and 1861. Giermen Lervpatye and Literotare.-The numerous dialects whith were spoken hy the different confederacies and tribes of ancient Germany were all derivatives from one loranch of the Aryan or Indofremanic fimily of languages, which seprated from the parent stock at a very early perion, although subsequently to the separaion of the Celtic. We can trace the co-existmee of the two liranches of Teutonic speech known as Low-Cerman and High-German as far hack as the 7th c., but there is no evidence to shew that they existed as common miform languages, from which their varionsly modified dialects were respectively derived. Accadins to the eminent philolorist Max Muller, there nover was one connaon Tentanic language which diverged int" two streams: while the ntmost we can benture to assert in regarul to the varions \} Iigh and bow Cerman dialects is, that thes respectively passal at different thanes through the same stages of grammatieal developuent. The High-German branch-which was spoken in the dialects of Swabia, Bavaria, and Austria, and parts of Franeonia aud Naxmy-has lien the literary language of Germany sinte the days of Chathmane. It may lechassitied maler there periuls - the Chat Iligh-German, datiog from the 7ther, and extending to the perisul of the Trusades, or the 1:2th c. : the Midule Jligh-German, beginming in the $12 h_{1} \mathrm{c}$, and contiming till the Jeformation: and the New Migh-German, tating from luther's time to our own days. The Low(femman, which in fermany itself has been little used in literature, comprehends many dialcets, as the Frisian (q.v.), the Flemish, I utch, Platt-Wentseh, \&e. The okd st literary monument of Low-German belonus to the eth c ., and is a Chistian epie known as The Ihlietul (the Healer or Siavimr); and afthonh there are traces of pombar Low-German literature up to the 17 the e, the translation of the Bible into High-German hy Luther decided the fate of Low-German. In addition to the various dialects which are commonly included under the heals of High and Law (iemman, an improtant evidence of the cultivation of a form of Ceman differing equally from the High and low grous has been preserved to us. This important linguistic momment is a fragment of a Guthic translation of the Lible, which was made in the the c. hy lishop, Ulfilas, and used by all the fothic tribes when they alvanced into Italy and Spain. The Gothic langnage died out in the Uth c. ; and after the extinction of the power of the Coths, the translation of Ulfilas was forgotten aud lust sight of till the accilental discovery, in the

## GERMANY

lGth c., of a M1s. peservel in the abbey of Werden, and containimg framments of this important work. This NA. is a cony marle in the toth e. of fltilas's translation, and frarmentary as it is, it athonds evidene of the high degree of develnment to which this diale thad been carich, aud exhihits a form of Spech which ladenes to meither the Hish nor Low derman gronj, but very possibly may have heen merely nue anourt bumerons other allicil forms of "'entonic spech which have perixherk.
The diffusion of Christianity ammen the fiemanio tribes hal the effect both of sumpersing the usio of the Rumic characters that harl beron cmanm to them, and of changing the tharacter of thorir literature, for insteal of the horme somgs and - heast-e lies' of a sanguinary paganism ('Thir-romes). seriptural paraphrases, lemends, and hymms wo re now sulected ; while the ancient form of :alliteration hy herres gave place to the thythmial aramece ment of the Latin versifiation common in the early 1 erime of the millle ages. Latm, moteover hecame the lamaze of the cont, the charch, am the daw under the saxon emperars. while Gurnan was left cutirely to the prople, untal the now incens, which were diffised hoth in resard to liternthe and lanshage during the Crusades under the rule of the acounplished euncros, of the Hohenstaufien line, hand the eflect of revising the use and cultivation of the vernacular dialocts, anmy which the Swalian, as the laquage of the court, swon acpuired a marked preponderance wor the others, In that age if thivalry and romance, the art of song was cherished hy princes and mobles, many of whom belongend to the arder of the Vimmesinger (or Singers of Love), and composed in the swatian or 1Tigh-German dialect of the imperial court. The: sulijects chiefly selecterl during the linth and I th centuries, luith by courtly and popalar singers, were based on the le sendary lore of tharlemanco and his paladins, ame King Arthur and his knights, and uf the Sangrae! : and it is to this perion that we must refer the Jibelungn Lied anl (iudrun, whirh rawk as the greatest treasures of Geman national literature. imong the most successful $\mathrm{p}^{\text {wets }}$ and minnesingers belonging to the swabian period, we may *pecially inticate Heinrich von Velleke, Ilartmann von der Aue. Wulfram wan Eschembich, Walther von der Vogelweide, Neidhart of havaria. In imich won ofterdiggen. \&e. The taste for the Thitreture received a now impetus amone the perple in the midule of the loth c. ley the re-translation, from the Wallon into forman, of the aucient Jorm of Remburd Fuches, which, according to the distin. guishol phindmist Jakol, (irimm, orivinated with the Frankish trifues. who carriel it with them when they crossed the Rhine and founded an enpire in Gaut, and from whom it was dithused amones the nuighbourin's tribes of Jorthern Franet anil Flanters.

The jerionl wheh succoctat the decline of chivalry was marken ly a thorouch nowlect. among the higher classes, of national literature, which thus fell into the lamps of the people, to the theromble lisorganisation of all frinciphes of prammar. To this age lelongs, howerer, the great mass of the Fulkslioder, or mational lallads, in which Germany is slocially rich: the fables amb satires of bumal ami of Niches, and the romances of the satirist Johnum Finclart. The ment riew and lassinh-phays, which were at their height in the loth e.., and still linat in the village of oberammergan, in Cmer Bayaria, may lu said to have given origin to the German drama. which numbere among its carliest cultivators, Sacha, Febhuhn, and Ayter. The elose of the $150 h_{1} c$ was polific in thyming historical chronicles, in satires on the clergy, anil
in theolongal writines for and agaisst the tottering pwor of the liomish Clnach. Tha, writings of Luther, his translation of the Bible, and the works of Cllich ron Hutten, Zuinglites, and of many of the other ruformars, wore, however, the most inportant avents in the histury of Cerman literature from the close of the lith the the midule of the lGth c.; and it must be remamberel that Luther andresset himself to the minds of his (wnitrymen nut merely throush his pulemieal watillsa, lont also by those mille hymons, which, sinee his day, have constituterl one of the createst litarary treasures of the kind. Some of the best of these Kirhh-finder. or church songs, were composed by Luther himself; while noxt to hian thase of suratus, Decins. Xichai, and Horberer, have frrhelp found mont fawour looth amone recmans and foreinners. These ferent ellusions of the devont and elopuont reforners wete followed ly a period of literary degqueration and starmation, which is in a ereat moasure to be ascribed th the demoralisiny aflects of the Thirty Years' War, when demmany was a pory to all tho cerils insepraraho from rivil war fosteral by foreig interference. The indirect result of this furion of anarely was to puonel the natimal surit. and sitiate the pondar taste ; for whil, the peetty courts aluel the halnts, languase, and literature of Versailles, the lower orders formet theirown haterature, with its rich treasures of legends, tales, amd ballads, and actuirel a taste for the cuarse camp-sougs impurtal by foreign mereenaris.s. and the immoral romaces borrowen from impure Fruch an! Italian surces. German poetry in the 17th e. was framed after the model of the later "lassirs, and their motern imitatore. The stuly of the genuine national literature was neslected, and althounh a host of learned societies were fumen, whose professal ohject was to purify and elewatus the pullic taste, the results were lamentahly uncatisfactury: and it was not till I. G. Gotsemell
 in lrawing attention to the turgid perlantry and artitioial stiffness of the classient school, that a hetter taste was awakencl. His wis pretentions lingotry gave orifin, bowever, to a connter-parts, frim which emanatul. at a somewhat later periut? the ficrman eusthetic school. under the gruidanee of A. Dammart n mal G. Deier. A faworable ratetion now tonk place, and with the names of K hopstock, Lessing, and Wieland hecan the hrilliant "pech of monlem German literature. Their infltence was alike :rent and varied: for while klupstock's 1oem of the Mensiohe, ane his oules, in which he hat taken bulton as his mukel, re-cehoed the tember piety of the ohl reformers. and were so thorandily Gemman in thoir spirit, that they at unce met with an enthusiastic response in the hearts of the fromle. Lessing's tragely of Mionne ra Bornhelm, and his dranat of Wathon dei Weiac, may be said to have created anew the dramatic art in cemany Wiclaml, "n the "ther hand, who was the complete antithesis of Kloustock, although. like lis two great contemperaries, be was the fommer of a new style, and gave a graceful flexilility to Cemman diction, which it hal never before hern malle to assume, latel inuparted to his mumerons tales aud romances an undisurised sensuons materialism, which, hake his style, had been borowell from the Prench philosuphiss of his day, and thus intrubuced into the kingure and literature of tiomany the groms of many ilefects, as well as praces, to: which they had hithertormaned strangers. The intlucnce exerted on terman literature liy these three writers, who may be regarled as jts regenerators, was soon anjreciable in tvery branch of buowledge; and amoner the galaxy of great names which have
impared renown to the literary and seientific annals of Gwmany during the last loo years, we can only instance a fow of the priucipal writers who have mone especially enriched the seseral inpartments of learning with which they lave leen assomiaten.
lhiksoplly, which in dormany originated with Leibnit?, who, however, wrote in Latin and lirench, assumed a deqree of individuality and emmpleteness thrount the intellectual acumen and subtle analysis of Kint. Fichte, Sehelling, and Megel, which have no parallel in any other conntry. Other mames worthy of mention in this departhent are IFerbart, Nompowhuer, and bawder. In thenhey, Remhard, laulus, schleiermacher, Ne:nuter, Jutins Mïlter, hake, Baur, Stranss, Mohler, Dillinger, and a host of others, have infused new life into bhblical inmury; whule invaluable aid las heen afforded in the same direction ly the profont philolocieal and critical researches of Wolf, Hermann, Miller, the erndite hrothers J. and W. Grimm, Borp, Benceke, Adelang, Lassen, Tosen, Schlegel, IV. Mumbolut, Lepsins, Bursen, \&e. In arehoulngy, history, and jurisprudence, all uationsowe a delit uf gratitude to linckelmam, Iteeren, Von lammer, shlusser, Von llammer, Gervimus, Dahlman, lianke, Niebuln, and Dlommsen. In poetry and belles-lettres, the name of Goethe (who livel from 1749 to 1832 ) is a host in itself. He had been preceden in the schond to which he attachad himself, which was known as that of the Starm- end-Drang period, hy llerder, its originator, Whose fhilosophical critiques of fureign and German literature, contributed materially to the complete literary revolntion which ushered in the moslern period of German poetry. In bis Leiden d"e Jungn Herther (The Sorrows of Werther), Gocthe earried the sentimental temencies of the school to their culminating point: lut his own later and bery momerons works leeane in time more and more free from the lbumishes into which he had led others. The Sturn-unl-Drant periml elosel with Schiller (175!-1505), whoseearly warks, The liohners, Fieseo, and Ion Citlos, threw the whole dierman people into a frenzy of excitement. IIs later dramatic works, if less exciting than these, gave evidence of more maturel taste. while some of his latlals and lyries may he said to le umivalled. In the present enntury, poetry has found mulle representatives in the so-called Foterlumblichter (Puets of the latherland), among whom we may instance Theolor Komer, and Arndt, whose spirited patriotic sones are intimately associated with the war of 1513 agriust Napoleon, in whel the former icll dichting glorionsly, F. Suekert and 1 . Chland belong to the same school; lout the former is more especially known for his admirable wexptations and translations from the Oriental langmages, and the latter for his exquisite romances and bahats. A still greator name is that of Heme, who may rank almonst with Goethe and Sehiller in poetie power. We may also mention the names of Muller, Haffoann rens Fallersleben, llaten, Freilisrath, Geibol, who, amidst a crowd of others, are hichly estemed in their native conntry: The induence of Gocthe and schiller extended in a marken degree to the drama and to novel-writing. ln the fomer department, litiand aequired great rephtation as a writer of sensation dramas, A. ron Kintablue as an inexhanstille composer of light effertive comedies. A. Nallacer Y. LLonwall, F. Grilhnrzer, and E. Rampach for their historical and sucial tragedies, while C: Immermann (who is butter known as the author of the novel Mïnchhertsen), Nosen, Litulne, and (i, Freytag, liave all produced ginn dramatic ricces. Among the host of novelists who have muleavored to fullow in the stel's of the great leaders of the Surm- umb- Drang
priod, the majority do not require notice. J. P. Wichter, the satirist anel humorist, stands forth, howerer, apart from, and far ibove his eompeers: and few novelists ever exurted so lasting an induente on the literature and mode of fecling of their endyratriots as that whill lichter exercised orew the minds of the midde chasses of Germany, during the elose of the last and the early part of the present century Among other writers of note, we may instance be la Notte Fuuqué, A. Joblimann, and A. C'hamisso, whose tendencies were to dwell on the mysterions agencies of nature, whiel they attempted to inclividualiso, and lning into assomintion with material forms, as in the Codine of the first, the fantastic tales of the secumd, and the Pefer Schleminh of the last-named. C. l'ichler, Spindler, 1T. Steflens, C. Gutzkow, Sternherg, W, Häring (the imitator of Sir $\mathrm{H}^{*}$. Sentt), IIauff, Zschoklie, an admirable writer of norelttles. Hacklinder, Ida v. ILahn-Halm, Auerbach, the narrator of village tales, and Freytag, the author of a social novel, soll und Haben, have all in turn enjoyed universal popularity.

But ntumerons as have leen writers of poctic and dramatic literature during the present century in Germany, the tendency of the German mind has of late years been rather to seience than fiction; and the immense impetus given to the taste for scientific inquiry ly A. y. IIumboldt's travels aurl ohservations, and by his C'osmos and liews of Fature, has been followal ly the prosecution of the most profonml researches in every department of physical and natural science, and hy the appearance of a multitule of records of travel, among the more important of which we can only instance a fuw, as, for example, those of Martins in Brazil, l'ünig in S. America, Tschurli in l'eru, Schabert in Freece, Lepsius and Brusech in Equt, Schomburgk in British Gumana, Ghitalatl in Chma, Sielold in Japan, the three hrothers Nehlagentweit in the Alps and in Central Asia, Barth and Vogel in Africa, and Leichbarit in Australia. In conclusion, we can only gronp together the names of a few of the many eminent Germans who by their labours have at once enriched the science of the world, and enhanceld the literary and scientific glory of their own country. Without again referring to rriters whom we may already have mentioned, we may specially instamee, in astronomy and mathematies, Bessel, Encke, Struye, Cianss, and Mairler; in the natural sciences, and in menticine, I. Aliilfer, Ehrenberg, Carus, Oken, Schleiden, Ton Theh, Lielig, Kopr, Simon Dove, Valentin Moleschott, Thischotf, Ruse, Pogrendorf, Erdmann, Gmelin, Grife, Sogel, liokitansky, Wagner, Schöncin, anel Dieffenhach; in history ank lionuply, Nieluhr, Leo, Duncker, Preusis, l'ottiger, Varnhagen $\begin{array}{r}\text { r. Euse, Pertz, Lappenbers, }\end{array}$ l'inli, \&e: ; in geography, etlonology, statisties, anel trasels, Berghans, letermana, stein, Hiabner, Kluden, Kohl, lewinbeck, Eunsen, Ideler, Kassen, Tnger, Zinmermann ; in the history of language, litcrature, and the tine arts, and on jolitics and the social sciences, Vilmar, bouterwek, Knno, Fischer, Waagen, leinsius, Heyse, Beeker, Crenzer, Lersch, Wachler, Ernesti, Jacols, Savigny, Eichhorn, Bülow, Ersch. See Grinm, Geschichte d. Deutschens Sprache, and Deutsche Grmmatik: Bopp, (omparative Grammar: Bessel, L̈cber das Lelien dis L!fila: M. Miiller, On the science of Langucge: Koberstein, Gundriss der Deutschen. Nationatiteratur: Vilmar, Forlesungen über die Geschichte d. Deulsch. National. literatur; Hallam, L'urope in the Middle Ages.

GERNLEN (Lat. a Eprout), or $^{\prime} \sigma^{\prime} A l i \mathrm{~S}$, the lowest :and thickenel part of the Pistil (q.v.) of a dlower ; containing in its earity the radiments of tho seels, ealled Oeules (q. v.), attached to the Placenta
(q.v.) often ly umbilical cords (q. v.). There is often only one ontule in the germen; sometimes it consists of a number of Carpels (q.v.), with one ovule in each; oceasionally the eavity of the germen is divided into cells, each of these containing one, and often many ovules. When there are many ovulez, some of them are generally abortive. The germen is sometimes superior-that is, it is free in the centre of the flower, as in the poppy, stock, and carnation; oceasionally inferior, the caly $x$ being wherent to it throughont, anl the uper part or limb of the calyx thus seening to arise from its sumbit, as in the pooseberry, rose, campanula, and snowdrop; sometimes it is half inferior, as in Saxifragu aranulate. The germen develops itself into the Fruit (q. \%.), after the flowering is over. Some plants bend their llower-stalks to the ground after Howering, press the germen into the grount, and ripen their fruit in the earth, as a species of Clover (Irifolium subterraneum), and the Ground-nut (Arachis hypoybec). Sec Arachis.
GERMINATION (Lat. sprouting), the heginning of growth in a seent, or of the vital action by whiel it is converted into a mew plant. Sce Seed; and for what is peenliar to acotyledonous plants, see Spone.

GERO'NA (anc. Gerunda), a city of Spain, in lat. $41^{\circ} 55^{\prime} \mathrm{N}$., long. $2^{2} 50^{\prime} \mathrm{E}$, capital of the province of the same name, is situated at the conthence of the Ter, with its attuent the Onar, 60 miles north-east of Barcelona. It consists of an oll amd new town, the latter irregularly built on the declivity of a rocky hill, ont highly pieturestue, and containing a beantiful and lotty Gothic cathedral, commenced in 1316, and approachel ly a superb tlight of steps. Besides the cathedral, there are five churches and twelve convents. The inhabitants cary on the manufacture of paper, soap, nod leather; and spinming and weaving. The tity is fortitied by high thick walls, and protected by four forts. Pop 14,61\%.
G. was of loman origin, and was formerly the residence of the kings of Aragon. It has suffered much from siegef, of which the most noteworthy was that of 1809, when the lirench with 35,000 men cheompassed and assailol the town. The besieged, unprovided with everything, even with ammantion, maintained a defence for seven muntlos and tive days arainst seven opren breaches, and were forced to capitulate only when their heroic govenor was struck down ly famiue and disease.

GEROPI'GIA. or JERTPICLA. Of late years, a cousiderable quantity of this material has been sent from Fortugal to this country. It consists of grape juice mafermented. and colouring matter, probably the cxtracts of rhatany-root and logwool, with sufficient brandy and sugar to jreserve it from fermentation. It is used for giving a spurious strensth and coltur to red wines, more especially to those intended for exportation-the factitions compound being mixed or vatted with the wines in bond. At least 90,000 gallons are now imported annually, and this large trade las sprang up within the last fifteen years.
CELIS, a department in the south-west of France, is formed of prortions of the oll provinces of Gascony and Guienne. The department of Landes intervenes between it and the Bay of Biseay, and that of Hautes. P'yréntes between it and the frontiers of spain. It has an area of 2403 square miles, and a pol. ( $15 / 2$ ) of 254,717 . The surface toward the south is mountainous, covered with ramifications of the Pyrenees, which extend northward in parallel lines. These hines decrease
in leight as they advance, and are separated by fan-shaped valleys, which are only a few yaris wide in the sonth, but expand to a width of several miles in the north of the department. The prineipal rivers are the Gers-which qives its name to the delartment-the Losse, the Baise, the Arratz, the Gimone, and the Save. The climate is healthy and temperate. The suil is a stiff loan, resting on thick layers of clay, and is only molerately liroductive. Nore than one-half of the surface is levoted to agriculture, one-seventh is in vineyarls, and the rest in mealows, heaths, and forests. Wine is produced in considerable quantity, bat of an inferior quality ; great part of it is converted into A rmagnae lirandy, which, after Coguae, is esteemed the liest. The manufactures and exports are inconsiderable. The town of Auch is the eapital.

GFRsON, Jlas de, one of the most eminent scholars and divines of the Ith and loth centuries. II is proper name was Jean Clarlier, the name of G. being griven to him from the place of his birth (1363), the villace of Gerson in the diocese of lheims. He was elucated in the university of l'aris, under the celehrated Peter d'Aills: Here be rose to the highest honours of the miversity, and ultimately to its chancellorship, having acynired by Juis estraordinary Jearning the title of "The Most Clrristian Docter.' During the unlarpy contests which arose ont of the rival clains of the two lines of pontiffs in the time of the Western Schism, the university of l'aris took in leading part in the negotiations for union; and $G$. was one of the most active supporters of the froposal of that university for jutting an end to the schism by the resignation of buth the conteuding parties. With this riew, he visitel the other miversities, in order to obtain their asseut to the plan proposed by that of Paris. But although he had the satisfaction to sce this plan carrici out in the conmeil of P1sa, it failed, as is well known, to secure the desired union. In a treatise inscribed to bis friend W'Ailly, he renewed the proposal that the rival jontills (now not two, but three since the clection of John NXIII. at Pisa) shoulil be required to resign; and in the new comacil held at Constance in 1414. he was arain the most zealous advocate of the same expedient of resignation. It is to him, also, that the great outlines of the 1han of church reformation, then and afterwards proposed, are clue. But his own persmal fortunes were marrel by the animosity of the Duke of Burgundy anl his alherents, to whon $G$. hat become obnoxious, and from whom he had alreaty suffered much persecution, on account of the hohiness with which he had denonneed the murder of the Duke of Orleans. To escape their rengeance, lee was forcel to remain in cxile; and he retired from Cunstance, in the disguise of a pilcrim, to liattenberg in I'avaria, where he composed his celebrated work le Consolatione Theolughir, in imitation of that of Boethius, De Consolatione Philosophier. It was only after the lapse of several years that he was enabled to retmon to France, and take up his residence in a monastery at Lyon, of which his hrother was the sulurior. He devatel himself in this retirement to works of piety, to stmely, and to the education of youth. He died in 1429 , in his G6th year. IIs wats, which are among the most remarkable of that age, till five volumes in folio. Among the books fommerly ascribed to him was the celebrated spiritual treatise On the Imikution of Christ; hut it is no longer doultful that the true anthor is Thomas-a-Kempis. See Fewris. The authority of $G$. is much relied on hy the advocates of Gallican principles; but the Uitramontanes allege that the principles laid down by him as

Amement, callerl also G. mn lommek, was in 1300 appmintwl joint governor along with lerenger von landealners of the Wablatalten or Forest Contons (Achwytz, Interwalden, and (Tri), ly Albrecht lof Anstria. Accurding to the traditimes eomected with Tell (q. . .) his oppressive edicts and wantom cruelty so enrared the mhatit. ants that a conspiracy was formed against him, and he was slot by Tell in a yarrow jass near kidenacht in 1:3\%.
 was lomen at Ziirich, lst $A_{1}$ mil 1730, and apprenticed to a hookedler in Ferlin in 1749, but soon tan away from his master, and conleavoured to earn a livelilown ly landsape painting. From Serlin he went to $H$ Himbure, where he formsed an intimate friendship with Ifruchlom. On has retum to Zirich, he pmblished Daphonis, which was followed by Inkle and Yarico, a small volume of idylls, and Tand Alucts (the Death of Abril), a spocies of idylic herome prose poem, which, though the fectlest of all his prondions, is the lest linown, and the one on which his clain to the natice of posterity rests. He afterwards turneal his attention for sebctal years exclusively to painting and engraving, in the latter of which arts he attainel high execllence. Some of the engraving with which he jllustrated his feeblo poctry are sad to le worthy of the first masters. In 17:2, he published a scound volume of fallo. and a series of hetters on landscape panting. lue deed ol Mareh 1787.
GESTA ROMANOREM is the title of the oblest legentary work of the middle ages. The storiws are written in Latin, amd for the most part are either taken from the histnries of the Loman emperors, or at least are referred to the period in which these tlourished. At a later perion, moralising expositions were alded, whence the work obtained the name of Mistorive Moralister. The (i. Ii. leflones to that class of works with which the monks were wont to hernile their leisure hours, and which were apminted to be read in the refectury. The stories are short, and destitute of rhetorical ormment: neither have they any dialones or tragic incidents. Their attrac. tiveness lies in the charm of their nairete and chiklake simplicity: althongh their artless prety often passes into a decp mysticism. Down to the 10th c., the (i. I. Was one of the most widely read looks among the learned, as the number of manuscripts and of printed impressions shortly after the invention of printing (the tirst was issued at Cologne in $1+2$, ) prove. At an early period, it was translatel into l'reuch, English, German, and Dutch. The oldest Dutch trauslation was molished at Goula liy ticrard Leeu in 1481 ; the bhast German translation at Augshurg, hy Hans Sthonser, in 1459. Amone the oldor Eaglish translations may he mentioned that hy R. Iubinson (Lond. 15\%). Recotly (18wt), the liev. 0. Swan publisheal Gesta Romenorum, transhted from the Latin, with Preliminary Oberrations, and Copions

Notes. The later German fabulists and novelists, such as Hans Sachs, Burkand Walelis, and others, made almmlant use of this great storehouse. Lut some after the licformation it was thrown into the lackgromd, and even in the monasteries, where for a lony time it mantained its footing, it was at length forgotten. Iecuntly, however, amid the sconcral revival of interest in the literature of the prast, it has received special attention. Its author hats been surpuosed by some to have been Petrns Berchorins or Berchear of Poiton, who died prior uf the Benedictiue Abbey of St Ehei in Paris in 1362, but it is now believed that he only added the moralisings; and Graisse, in an appendix to his Corman translation ( 2 vols., Iresd. and Leip. 1842), has shewn that a certain Elimandus is tho author or compiler of the work. This Elinandus was undonbtedly a monk, and was either an Englishman or Gemman, as is clear from the numerous Germanisms and Anglieisms that pervade the Gesta. The most recent edition of the original text is that of Feller (Stutt. and 'Tiib. I842).

CESTA TION, in Physiology, is the term applied to the leriod that intervenes in the mammalia between impregnation and the bringing forth of the young. The period and the number of young promed at a linth wary extremely in different mammals, but usually stand in an inverse ratio to me another. Thus, in the larger herbivom, as, for cxamply, the dephant, the horse, the ox, and the camel, the female seldom produces more than one at a time, lut the period of grestation is long; while in the smaller ones the progeny is numerous, hut the prive of gestation only a few weeks. In the eleWhant, the period of restation extends over twenty or twenty-one monthis: in the giraffe. it is fourteen months; in the dromedarv, it is twelve months; in the raare, upwards of eleren months; in the tapir, between ten and cleven: in the cow, nine; and in many of the larger deer somowhat more than eicht months. In the sheer and goat, the period is five months. In the sow, which produces a mmerons litter, the priod is fonm months. In the rodentia, the progeny is mmernus and imperfeetly developed, and the priod of gestation is comparatively short: in the beaver, one of the largest of the order, it is finn months; in the rablit and hare, from thity to finty days : in the dormouse, thirty-one days in the squirrel and rat. four wecks; and in the guinealifs. three weels or less. The young of the carnivora, like the young of the rodentia, are born with their eyes closed, and in a rery immature condition; and in even the larger carnivora the period of gestation is far shorter than in the larger ruminantia or bachydemata: it is six months in the bear; one hundred and eight days in the lion (the perion in this animal is stated lis Van der Hoeven at three months) ; seventy-nine days in the loma sixty-two ir sixty-three days in the llog, the wolf, and the fox and fiftryfe or fifty-six days in the cat. In the marsupial animals, which, from a structural peenliarity, produce their young in a far more immature state than any other mammals, the periol of gestation is very short, leing thirty-nine days in the kangaroo, the largest of the marsupial animals, and only twenty-six lays in the opossum. Nothing certain is known regarding the periol of gestation of the cetacea. The quadrumam prolnce one, sometimes two. at a birth; and the periol of gestation, as far as has heen observed, secms to be seven months. In the human race, forty weeks is the usual periol of gestation, hut this perind is liable to certain devia. tions, which are noticed in the article Ferus.

GETA, a people of Thracian extraction, who, when first mentioned in history, inhabited the

## GETHSEMANE-GEYSER.

country which is pow called Bulgaria. 'They wero a warlike people, and fur a long time suceessfully resisted the attempits of Alexander the fireat and l'yrtus to subhlue them. They afterwards removed to the nortly lank of the loanube, having the Daieper as their lommary on the rast, while west. ward they eneroached on the lioman empire, with Which from this time they wern continnally at war. They were callad Baci by the lionians. and their conntry liacia, and are often mentioned in the literature of the Aucustan was as surge and unconquerable foes. Jhrine the reinn of Domitian, they overcamo the fimmas, ami exacted an aunaal tributs. Jout in $]$ (his, their gallant King, Decebalns, was dutuated by Trajan, and the pople completely sublued. I Foman colnoy was settlex in the crimtry, and becomins incoppisated with the $G$., save rise to a mixal race, the modeth Wallaclis.

GETHSE'MIANE (Hel), Gialh, 'a winc-press,' anl Shemen. 'oil"), the scenf of om Siavion's agoby on the wight lufore his t'assion, was a small fam or cstate at the font of Noment Olivet, and rather more than half a mite from the city of Jerusalem. Attacled to it was a garilen or orchiard, a favourite resort of Clarist and his disciples. The spot pointerl ont to molern travellers as the site of the grarlen of $G$, corresponds suliciently with the requirements of the Scrinture narrative, and the statements of Jerome aml Eusdins. It is a place about 50 praces square, enclosed by a low wall of loose stomes, aml contains ejght very old olive-trees. regathed with pions superstition as having existeri in the time uf our Lord.

GE'UM, a semms of plants of the matural ombr Fosacea, sub-oriter Putentillete, nearly allied to Potentilla, but alistinguished ly tle harlened hooked styles which crown the carpels, su that the fruit beeomes a bur. The carpels are ilry. Two species are common natives of britain. (i. urbumem, called Common Avmss or llemb Bexalitt, a herbateons plant, about 1 - 2 feet high, and (f. rivale, called

Genm Rivale:
$a$, carpeland awn; $b$, petul; $c$, stamen; $d$, pistil.
Water Avess, ahout one foot high, louth of which have the radical leaves interruptedly pinnate and lyrate, and the cantine leaves ternate, but $(G$. urbanum has erect yellow liowers, and $G$. rivale las nodling ilowers of a brownish hue. The former grows in hulges and thickets, the latter in wet
mealows and woods, and sametimes even in very alpine sitnations. both are aromatic, tonic, and astringarat, and are employed to restrin mucous dischareres, and in cases of dysentery and intermittent fever. The mot of fir. ritele is also used in diseases of the hladher. Iheront of (is. prhamum, when fresh, has a clowe-like flavont, whinh it commumiontes to all ; and fur this purpose it is yathered in spring before the stemgrow's up). (i. C'analens., the ('hocolate liono or Iibous Tioor of Sorth America, has some reputation as a millitomic. It is much employed in the Enited sitates in disenses wif the liabler. It mati reswolles the Pritish slecies in its leaves, nom has erect tlowers like $\theta$. udnomum. A mmber of other species are known, natives of the tomprate and colder regions both of tle northern and southern hemisyhares.
(iEIVSIER (Icelandic, grysut, to harst forth violontly, allienl to Ling. (fats) is is torm applied in lenland to the cruptive themal sprimes and wells Whach are found in varions parts of its surface in evident connertion with the voleanie furess at work bolow. The must remarkalile eromp of these simenlar objects is one about 70 miles, or a two lays ride irom liekiavik, 16 miles north uf skalhoit, and within sight of the voleano of Hecla. On the slope of a low trap hill. owerlvokfore the wille erassy valley of the Whitate or White River, a space of ground measuring lerbaps half a mule oach waty is thekly intersuersed with luiling or lout springs, of various sizes, from jets wot ercater than an werlmiliag tea-kettle, ul to great ciallarons, besines vestiges of others no longer in (u)eration. All are suronniled by silicions inemstations, formed in the course of time by the minute charce of silica infused into the water. The chict apertures are two, respectively called the Great Goysu and the Stroke (i.e. Clurn), which are little more than a hundred yards apart. The latter is an irregnlar aperture of from six to eight feet diameter, lown which one may in gatacral safely look, when be secs the water noisily working in a namower bassage abont ay feet below. If, hy thruwing in a sulleient quantity of turf, he cin temprarily "hoke this sullet, the wator will in a lew inmutes wercone tha resistance, and, so to speak, perform an cruption with maqnificent eflict, lursting up (i) fuet into the air, liown with the tmi that has Inon infused into it, aurl difusing steam in vast volnma's aromed.

The apparance of the Great Gevser is considerably diblereat. On the summit of anmunt which rises abont 15 feet above the surrounding grouml, is a circular poul or cup of lut water, $i=$ fect across at its greatest dameter, and about four feret deep, being entirely formed of silicions crnst of a elull gray colour. At the elge, this water las licen fomm to be $185^{\circ} \mathrm{F}$.; in the centre, it is emshlerably hieher. From the centre descends a pit of eight feet width, and 83 fect deep, up which is stream of highly leated water is continually but slowly ascemding, the sumpus linding its way out lyy a small channel in the clige of the enl", and trickling down the exterion of the crusty eminence. Every few hours, the water. with it rumbling noise, rises tumultuonsly through the pit, and jets for if few feet above the surface of the pool ; by and by, it subsides, and ail is quict again. Unee a diy, however, or thereabouts, this thandt cuds in a territic paroxysm, which lasts perlaps a quarter of an hour, and duriog which the water is thrown in repeated jets irom 60 to 80 feet high, ningled with such rulumes of steam as obscure the country for half a mile ronnd. If a visitor be toler. ably near on the windward-side, he may catch glimpses of this grand specticle-the ernption of a
watur－wheme，it may lue termel－and he must neads be charmel with the beantiful jets as thay rurse batwarls and fall，as wall as impressed hy the sublimity of the whone seeme．When puiet is restome the chalice and ferhars twonty foet of the fint，are foum cmpty，and the visitur olotains． sof far，a sight of the intemal arransements and Stracture of the perser，In a little time，the water reweends $t$ its ustal level，and there remains for the next lay on two，with men those minon disturl）－ ances which have ben deserilned．

## GHEE-GHENT.

laving foumled a monastery for Sufis, and a college for the studitus.
()f the ninety-nine works written by him (mostly in Aralbie, a few in l'ersian), the most famons is his llifi Jlimul- Ihan (Iestoration of Ieligions Sicences), a work so remarkalide and exhaustive, that it has hoen sait: "If all the books of the Island were lost, and we bad only this one left, we shonk not miss the others' (/Kiji K/ulifuh). The acatemies of the West, however, Cordowia, Marocen, F"oz, \&e., cond $\quad$ mued it as eontrary to the teachings of the Sumbit (q. Y.), and hal it publicly hurned. Next in importance stamels his ereat philosophical work Takafial $1 /$-Piluasfith ('lhe Overturming of the Phlosophers), which has survived only in Ilebrew translations, ant wheh save rise to a warmly contested enomoversy betweell him and Averroes (llns (a,shrel). Whe may mention also his commentary on the nincty-nine names of (iod, and an ethical treatise, () Chill! pulnished and translated into (:erman ly Hammor-Purostall. About one-third only of his works is known to lave survived, and of this hot a very small pant has been publishere.

GHEE, a limu of butter used in many parts of Tndia, and osencrally prepared from the milk of bultaloes. The fiesli malk is boiled for an lom or more; it is then allowed to eool, ame in little emblled milk, callerl thyee is alded to promote coamalation. 'Llie cumbled mass is chumed for half an hour: sume Lut water is then added : and the churning eontinued for another half hour, whon the butter forms. When the butter leosins to become rancin, which is usually the coase after a few days, it is bosiled till all the water contained in it is expelled, and a little dhye and salt, or betel-leaf, is added; atter wheleh it is put into chased pots to lee kepot fur usc: It is userl to an enormons extent by the natives of many jart.s of India, but is selumm rehished by liuromeans.

GFICIEL, a well-known exolony for the insame is a town of Belginm, in the province of Antwerp, anol 26 miles east-sonth-east of the town of that name. It is literally an aasis in a desert; it comparatively fertile spot, iuhahited amb endtivated loy 50,0100 or 11,000 leasants, in the miulat if an extensive sanly waste, called the C'ampine, where neither climate, soil, wor suroundings imite a settlement. There are no reutlemen's seats in the distriet, and the farmbonses, thenth neat, and gemerally sumromided by trees and a garden, are eviluntly in the lands of the poor. T?um frequency shews this. They are sometimes bunt of brick; mach more generally, they are constructed of wattled or wiclece work, thekly latul over with mud ur master, and whitewasled. (x. crotter"s homse is mmel larem than the dwelling of a small farmer in scotlanch. The peonle jubabiting these seem to be ahout the rank of Enelish cottarers, lut are inferinn in aspect, tone of character, and cleanliness of labits. The dwelling are arranged into three classes, or corchons: those uf the village proper; those satterad aromnt in its immediate vieiney; and those collected into hamlets in the more alistant aud least reclained portions of the eommune, which may be about of miles in circumferente.

1listurically considered, $G$, is motid as having been the spot where a woman of rank, said to lave been of liritush uriuin, was murdered by ber father, in eonsorphence of leer resistance to his incestorons passon. The parin in his revenge gave the elmoch if matyr. T'ligrims, the sick, the surrowful, ame the insume, visited the tomb of the Christian viruin; the last were restored to samity ame seremity. Dymphua becane the thtelar saint of those stricken in spurit; a slurine rose in her honame, which now,
for ten centuries, has been consecrated to the relief of mental disease, is sath to have levol distinguished by never-failing snecess, aul, it all events, lias collected around it humdredis of lumaties, chiedy of the juerer classes, hat labourine maler every form and stase of norvons malimly. Formerly, besirles the benetit derivalble from puximity to the aslos of the saint, ami from the prapers of the churel, the afilicted umderwent a sort of novitiate in a haikling adjoinine the elurch, whore they were chained to the wall, and subsequently passed under the mansolenm of their pratrom, $\mathfrak{x e}$; but now, althongh faith lingers, there do not appear to be any other than the ordinary ministratmons of the church to whicl the patients belons, resurted to as treatment.

About 800 insane fersuns are luled with the citizens of this commmaty, or with 600 leanls of families, and are controlled and cmployed lyy them, aud this withunt recouse to walls or ha-has, or other asylum ap户liances, and with little coercion of any liud. The wave and inalustrious reside generally one in eacla family in the town, the more excited in the suburbin eottages, and the must ummanagealle with the labonrels on the confins of the commune. The elfect producerl hy this larce looly of lunatics wandering, working, displaying many of their pecnliarities in the nuilst of is thriving sane population, who chietly depend upur a trathe in insanity, is buth striking and bibotaresque. In the enjoyment of eomparative liberty, and of what is called the free-air treatment, these patients are, upon the whole, contented, tranyuil, amb lanlthy. Tiolence is rare; only two subciles have occurci in four pears: aul morality is less ontrused than in more protected chasses. Eith imbivilual is maintained for about $G \frac{1}{2} l$. to $7 \frac{1}{2} d$. mer reem. Until recently, this colony was merely a Ispeholorimal curiosity: recontly, the anomaly and alisurdity of treatimg all cases alike, and independently of medical am, have led to the iustitution of a veilical stalf, the erection of an lospital, and tho. introuluction of many salutary alterations in the relations between the insane and their custoliers, in elassification and supervision. The eompratibility of the seclusion of the insane with greater freedon, with domestic life, and association with the sane, have surgested the introduction of cottage asylums, ats a mondication in the aceommodation of this class in this country. (Gheel out une C'olonie d'Alienés riraut on fixmile et en liberte, bar M. Jales Duvil. I'aris, 18 Gi.$)$

GIIENT (Flem. Gind, Ger. Gome, Fr. Cant), an important city of Delgimm, capital of the province of East liambers, is situatell at the conflumee of the Ly's and the schellt, 31 miles west-north-west of brussels. It is cliviled ly eamals into 26 istands, conmeted by 309 bridires, and is encompassed with givelens, mealuws, and pleasant promeruedes. It is surrommed hy walls, pierced by sewen gates, and tonclusinus an areat eirlit miles in eirenit, and is in fenceal well built: lunt in the older part its quaint mud fintastic homses render it in the hirhest degree bicturesque. Among the chiof builimigs are the ("hurch of sit Bavon, containiner the famous "Adoration of the Jambe' hy the brothers Van Eyck: the new citalel, finished in 1 sin ; the Palace of Justice, built in 1844 , ambllaving a prristyle of the Gorintlian order; the university, comuected witl a selumbl for civil enginetring, and for trades and proiessions; the Beguinare, a comvent containing about 700 muns; the royul fimuasime : and the Academy of Fanating. The cotton and woollem manufactures are earricid on on a great seale. There are many cotton-mills, and abont $\mathbf{2 5}, 000$ workmen are emplayed in the spinuing, printing, dyeing, and
$\qquad$
weaving of ectton, woollea, and linen fabries. Leather and laper are also mantuactured, and a flourishing trade is earried on in floriculture. Extensive flowerdealors are engaged in this branch of trade. by the Cireat Canal, which flows into the schelelt, is. is united witl the sea, and it can receive intor its loeks vescels drawing IS feet uf water. The new dock or basin on the north-east side nf the city is capable of holdin! 400 vessels A handsonne staitue in honnur of Taçues van Artevide was rected at (á. in IS63. I'(0). (1569) $1: 1,-169$.
Ci. is mentionel in history as carly as the oth century. About the war Sos, Balnmin las-ale-Fer, the first Count of Flaniers, luilt a fortress licre as a defence arainst the Nommans. Cnder the Counts of Flanders, $f_{r}$, contimued to puosper and incrase, matil, in whe luth c., it was alble to stad 50.000 mon into the dield. The wealth of the citizens of G., and the masmal masare of liberty which they enjoyed, encomaned them to resist with arms any attempt to infrime upm their peculiar rights and privileges. 'J'his readuness to arm in their own derence is exomplitied in the famous insurrection of Jacobrvan Artevehle (t. r.), aud other instances. For many years, it mantanued a vigornus, lant marailing resistance against the Hukes of Burarnaly-who wished to be recosmised as Counts of Flamers-anl the kines of spain. In the varions wars of which the Nethorlands has heen the lattle-sround, ix. sulfered sucurdy, and was frepueatly taken. In lo!日, the Netherlambs fall umber the power of France, and (r. was mate the capital of the dejartment of the soleddt, eontimming under Fremeh dominion until the fall of Napoleon, in 1514, when it was ineorporated with Flamers in the kingdom of the Jetherlavels.

GHERARDE'SCA, a family of Tuscan orisin, which enacted a conspicuous part in the history of the Italian republies during the midule ages. Their vast territorial pussessions lay hetween Pisa and Piombino. In the 13th c , the Counts G . exercised a preponderating authority in the republic of Pisa, and were Irominent supporters of the popmar interests, in opposition to the encroachments of the nobles. In the great feud between the Guelplis and rihibellines, they lecame wamm partisans of the latter, and were the irreconcilable enemies of the Visconti, who headed the Cuelphs. The most famons of this fimily, both with respect to the bistorical erents of his career, and the appalling tracely of his fate, is Conat Coolino, whose name and fate have been invested with undying interest ly J ante. Count Ugolino, more than anyuif his race, was possessel by a lawless ambition, aind a subtle, unserupulons spirit. Having resolvel to usury' supreme power over Pisa, lic formed an alliance with Ginvanni Visconti, the hear? of the Gnelphic farty, who fromised to suplly lim secretly with solders from stamia. The plot was, however, discovered, and both Giovinni and Tirolino were hanishedfrom the eity. The former ded sonn after; but the latter, miting himself with the Florentines aud the Lueclsese, Curend the F'isans, in $19-6$, to restore him his territorics, of which he harl been deyrivel. No sooner was lie reinstated in his lossessions than be beran to devise anew anmitions schemes. The war of the lieare with the Gunnese afforded hin the opportunity lie desired In the battle fought at the island of Nalora, 6 th August 12st, Cipolino, by treacherously abandoning the Pisans, oceasioned the complete annibilation of their fleet, together with a loss of $1 I, 000$ prisoners. When the news of this disaster spread, the Florentines, the Lincchese, the Siconese, the Pistoians, and all the other enemies of the Pisan republic, gathered together to destroy it, as the stronghold of the

Ghibellines in Italy. Being thms brought to the brink of ruin, the J'isans lial no other resource left than to throw themselves into the arnas of him whose trearlacry hal redncer? them to such misery. From the time of his election, le gave free seope to his vimicotive, despontic natmre, persecuting and hanshing all who were privately obmoxinus to him, on lretexts of state dulinumeney, till at lonerth a ronspiracy was formed aqainst him, headed fy his former supporter, the Archbishop of Tisa Draggel from his palace, lat July Fous, after a despcrato defence, he was thrown into the tower af fiallandi, rith his two sons aml two grandsons, where they all perished amid the agmates of starvation, for which reason their dungeon bas since borne the ominous name of the 'Tower of IItnger.' Iu suito of this, the family again rose into importance ; and in ly:3 we find Jieri Inonatofico (i, at tho lacad of the republican authority in Pisa. see Aimmondi's IIsstor? of the Jhelian I'? mublics.
 I.LNE.

GHIBE'RTI, Loms.xzo, a famous Italian senlıtor, was learn at lournce almut $1: \%$ s. Je was mucated in art ly his stepfather, a skilful goklsmith, aud manily acpuired dexterity in draving, painting, and modelling. It the ane of 19, he was selected fur the execention of a mble frescon in the patat residence of Prince Pandolio Nalatesta at Simini. Along with seven other artists, he was next chasen lyy the Florentine muilal of merclaats to compete for the execution of a splendisl gate in bronze, to suit that executerl by Ambear lisano in the luaptistery of Florence, about l:3+0. The subject of the desint was The sacrifice of I witac, to he executed in bas. relief as a model fur ond of the panels. The judges fomad a dilliculty in deciding letween Brundlesehi, Donatelli, and G., but the two former crenerously proclaimed the superionty of fi.'s design, Loth with respect to the art and beatuty of its conceprion, and the delieacy and skill of its execution. When G. had completed his great work, his fellowcitizens intrustal him with the execution of another gate, to emulate the beanty aml colossal dimensions uf the two alrealy ulorning the baptistery. Jrom Michael Angelo, is. received a noble tribute of atmiration, when the great artist asserted that the two gates were uorthel of Paralise. ( $\because$ 's second gate contains ten reliefs on a larier scale, the subjects in this case also heing wholly liblical. 'The mingled Erace and graneleur of these compnsitions are beyond all praise. Not the least of (r.'s merits was the success that attended his elforts to break up tho conventionalism that before his day hanpered the free development of sealporal art. Among his other works may be mentionel a loronze relief in the Duomo at Florence, representing San Zenobi bringing a deal child to life, and bromze statnes of St John the Baptist, St Matthew, and st Stephen. Cr. died at Flurence in 155.

GHI'lís, a prinely family of thanian origin, which has given many hospmars to Noldavia and Wrallachia. The founder of the House was George Ir, an Albaman by hirth, who, through the favour of his compatrint, the grand vizier, Mohammed Kimpruli, was raised to the dienity of Hospolar of Wablachia in 160\%. He was suceeeded ly his son Gregory G., who ruled, with various vicissitudes, till lö3, and receired from the Emperor Lenpold I. the title of Prince of the TOly lioman Eurpire. Of subsequent members of the family, the only ones calliner for special notice are Alexamer, Gregory, and Helena.

AlexiNofer finiks $\therefore$ was born in 179. , and, through the inftuence of the Iussian Count Kisseleff,

Khasru Whlek, the serenteenth and last monareh of the dynasty yf Ghizni, ocemper himself in the first part of his reign (1160-1166) in extending and eansolidatios his Indian possessions, hut sulnsernently his while encrics were reguired to repel the attackis of shalah)-ad-icen Dlahmmet, I'rince of Chint. Who having conquered all the turritury west of the lulus, now somblt to drive the race of buldektentin from their last possession. In 118t, Lahore was all that remained to kinsrù Melek, and the taking of that city loy the Chatian frince in Ilsid put an end to the power of the Ghiznesides.

CIIIZNI. a river of Afyhanistan, luses itself, after a sumtleerly course of about 50 miles, in the salt lake of Abistata, which is 7076 fect above the sea. Its source is 10 miles to the north of the city of its own name, and its month is abont lat. :3o ois No., and longe $68^{\circ} \mathrm{E}$. Its enbonkments, dating from the lith c., are still fit for the purposes of irrication.

GHIZNI, the city mentioned in the preeeding article. stands at an elevation of $7: 2$; feet. on a searped rock, which rises aso feet abowe the adjacent plain. Its natural strength has heen increased loy walls of Bor feet in heinht, and a wet ditch. It has long heen a place of importance in Central Asia, having been, in the llth e., the seat of an emprire (see Ghizminims). Some of the most interesting foints in its history, howerer, are moch more recent. In the July of $18: 39,6$. was stormen hy the british muder Lond lieane: aml in lsta it was tirst surendered to the Afyhans, and then retaken by freneral Nott. Eventnally it was restorel, with the rest of the country, to Dost Moh:mmed. It is situated in long. $65^{\prime 3} 15^{\prime}$ E., and lat. $33^{2}$ $34^{\prime}$ N.-a parallel which, uuder the minnence of the remarkable altitude of the spot. yields, in winter, a templutare of about $20^{\circ}$ Fah. below zero. 'The pmalation has been varionsly estimatel up to 10,000, Hnctuatine most mobably with the season of the year. G. is an entrepôt of the trade between Afghanistan and the Pumjab.

GHOGRA, or GHAGRA, one of the largest afthents of the tranges, joins that river from the luft in lat. $25^{\circ} \cdot 16^{\prime}$ N., and long. $84^{\circ} 40^{\prime}$ E., alter a sentrally south-east course of 600 miles. It rises in lat. $30 \quad 20^{\prime}$ N., and lous. $80^{\circ} 40^{\circ} \mathrm{E}$, on the sonthern deeliwity of a momanan-range, which separates the district of Kumaon from simath-West Thibet. 'The actual sonsce, being hetween 17.000 and 18,000 fuct abore the sea, is hidden under per1 etual snows at every season, while in winter it can searecly be said to tlow at all. Thronghont the first 50 miles, the torrent. tumbling as it does down deep gorges, is in many phaces entirely conceated by glaciers. After receiving many tributaries on louth sides, it enters the great fain of Hindustan in lat. $299^{\circ}$ (3., and long. $30^{\prime} 13^{\prime}$ E., being now, after a rm of Its miles, 7 g feet ahove the seal. Ilere it has been estimatent thle abont twothirds of the size of the Ganges at the corresponding puint of Hudwar. Witherto it has generally formed the bonndary between Kumam and Nepral. Pufore the G. has desecmidel $\overline{7} 1$ miles forther, it has become navigable for craft of considemble burde. Further Cosm, it is praticable for hoats of all sizes at urery seana, hat is lore and there leset by dongermis and intricate shonds. Like uther great rivers traterom alluvial tracts (see fanges), it
 season chmmunicate with the farent-floul and with each uther. The prineipal anxiliaries, to talie then in orter, are the kialipani on the loft; the Whouli, on the right ; the Gorigunga, also on the right; the Chmailea, on the left; the Western Sirgin on the right; the Lohomatalu, on the right; the Larhin, the last of its hill-tributaries, also on the right, the linuanli, on the left; the mited "homka and Wiol, on the right; the Eastern Surju, no the left; and finally, the Rabit, also on the lut.

GHOST-DIOTII (Ifonialus hemuli), a speeies of math fery common in many parts of Lritain, am of wheh the caterpillar-popularly liwown as the (ITten- iften commits great ravages in hop plantations, shouring the roots of tue low It iceds alsu on the routs of the uette, burdock,
and some other plants. This moth helongs to a family (Hepiulide ${ }^{\text {a }}$ ) often popularly called Suifts from their raphe thisht, having long narrow wings, and destitnte of a tonguc. The antemue are short. The male (x.-2l. is entircly of a satiny white colour above; the fonale sellowish with darker markings;

Ghost-Moth (IIepialus humuli):
1, eggs. natural size; 2, the same, magnifed; 3, larva or caterpillar; 4, chrysalis; 5 , imugo or perfect insect, male; 6 , the same, female.
both sexes are lrown on the muder side. They are to be scen flying abont in the twilight, generally over lawns and pastures, not unfrequently in churchyards, from which circumstanee, and from the white colvur of the males and their sudden disappearance in the imperfect light on their folding their wings, or rising ahove the level of the speetator's eye so that the brown part is turned towards him, they derive their name. The caterpillar is vollowish white, with scattered hairs, sometimes nearly two inches long. It spins a large eylindrical cocoon among the roots on which it has been feeding, and there becomes a clurysalis.

## GHOSTS. See Aprimtions; also Supp.

GHUMURDJINA, or KOMULDSI'NA, a town of Luropean 'ruker, in the eyalet of Tumili, is situated on the riglit bank of the Karadji, about $s 0$ miles south-west of Adrianolle, It has extensive bazarars and a small eitadel, and is supposed to contain about su00 inhalitants.

GHULR, or GHORE, a mountainons distriet of Western Afghamistan, lyine sonth-east from I Ierât. It was eonquered by the famuus Sonni hero, Malimind of Clhizni (g. v.), and about three centuries afturwards was overrun ly Genghis Khan. who almost completely exterminatel the ancient inhabitants. It is celelmated in listory as having been the original possession of the princes who established the seend Mohammeilar dynasty in Hindastiu. It is inbabited at the present day by the independent nomad Tartar tribes of the Hazarch and. Eimâk, prineipally the latter.

GHÚRI, or SULTANS OF GHỐR, were a race of $p^{\text {rinces }}$ who had the seat of their empire in the country of Ghut ( $\mathrm{q}, \mathrm{r}$ ), and ruled over Persia, Northern Hindustan, and Transoxina. The tirst of this family mentioned in history is Suri, who opposed an obstimate lut unavailing resistance to Sultan Mahmul of Ghizni. One of his duscentants, named Husseyne, was subsequently aljointed govemor of Ghur, in which office he was

## GlANLDELLI-GIANTS AND DWARIS.

succeeled by his sons. But Eehram Shah having put to death one of the brothers, the others threw off their allecriance to the race if subekteghin, and hostilities ensued (see GHizsemines), in which the eldest brother, Sceyt-ud-deca, was killed, and his brother Allali-ud-deen, smonamel Jeham-sonz (the ('onllagrator), sncceeded to the suvereignty. After subluing the sultam of thizni, Allah-ulfleen invaded lhhorassan, but was defeatml and taren prisoner ly Sultan Sunjur the Suljok. He was succected liy his sim Mahommen in 1160. who was assassinatel at the chd of the first year of his reign. Gheiatheddin Mahommed aseendel the throne in 1161, and after a long and blowly contest with the Khaurezmians, succeedel in olstaning possession of Khorassan. During his reing the atiais of Chizni were committed in charge to his lrother, Shahabuideen Mahommed, who, havin's sulutuel the Ghiznevide ${ }^{\text {morinees }}$ west of the Indus, crossed that river and conquered successively the porinces of Mûtan (1176), Lahore (1186), anl A jmere (1199). defeating the rajah of Amere"s army mumbering 300,000 horse and 3000 elephants, anl in the conrsce of the next six years conquering Hinletan as far south as Dagpur, and westwarl to the Irrawaly. It is from this cimech that the preponderance of Islam in Hindustan is latal. Siahab-nd-leen succeuded to the throne in $I 203$, on the death of his brather (see (immanimes). The house of Ghur had now reached its acme of power, their territory extending from the Caspian siea to the Bay of Dengal, and from the Jilon to the Indian Ocean. Shabab-nd-dent, having invaled Khaurezm in 1ool, was attacked by the sultan of that country. and completely ronted. In the following year, lie undertook an expectition into Fojnd , an the sonth border of Cishmere, in order to relnce that rehellious province, in which undertaking he obtained complete success, hat on bis return was assassinated by one of the Felayam, or finlowers of 1 hassun Sabah, in 1206. His nejhew, Mahmud, succeeded: but after a short rein of four years was asaassinated. Aiter his death, some members of the family made feeble efforts to revive the grandem of their ancestors, hut as the sultans of Fhamezn had by this time subjugatenl the whole Persian empire, their attempts vere fruitless.

GIANIEELLI, ur GIAMEELLI, Federigo, a famous military engiueer, was Inon at Drantua abont the year 1530 . After serving for some time in Italy, he procected to spin and ufteres his services to Ihilip. I1.; lutharing failed to oltain an audicuce of that numarch, and entreiving. morenver. that he had been persomally slighted, he alomptly quitted Madrid. swearing, as the story gous, that the Spaniards would zot hear of lime and after a residence for some time at Antwerp, where be acquired a high reputation as an mechanist. $1^{\text {mased }}$ over to England and entered the service of Quecn Elizalieth, whe grantell him a lension. During the War of Independence in the Nethorlams, Alcxander, Duke of limma, gencralissimo of the Spanish forces, besiogen Antwerp it 1585, wherempn Elizaleth commissioned (i. to proceed to the assistance of the inhabitants. On his arrival. he foume that the Spaniarls had hoilt a vast lridec acruss the sicheldt, interrupting all commmication with the sea, by which alone the city could get movisions or help. Setting his wits to work, f. invented an infemal machine, which he launched against the lishoge one stormy night. The effect was irightful. The whole pranish army was roused by the noise and the Sohcklt was fomm to be quivering to its lowest cleptis. The obstructing bridge was blown into the air, and no less than su0 men-amont whom were some of the best $\mathrm{S}_{\mathrm{p}}$ anish otticers-were killed.

Many Spanish ships also were either lurned or sunk. The want of unity, however, among the citizens, nltimately renderel $G$.'s aid unavailing, and he was ohliged to retarn to Emyland. Itere be was employed at the time of the threatemen Spanish invasion in fortifying the coast-line, which he died in a very skiffil manner. When the Armada appeared in the Chamed, it was 1 . Who proposed and carried out the folan of sending fire-ships into the midst of the cnemy, and in this way greatly coutributed to their defeat. After this he disalipears [rom history, and all we know of him is that he died in Londm.
 lawyer, wat born, 1676 , at Ischitella, a village of C'apitanata, in Naples. He early distinchishal himself as an able and learned practitioner at the bar of Jiaphes, and soon realised an easy indepmatence, which ababed him to devote his time and carcies to his favomrite histurieal restarches. In his beatiful villa, adjoining Naples, he lahutured during the space of twenty years at his greatest historical work, which, in 17 in , he publishel in four volumes, under the title of Storim Civile del hegradi N"apoli. This valuable and eomprohensive work, not moly treats of the civil history of the kinetum, hat also contains learned and critical dissertations on the laws. custums, and aIministrative ricissitures of Findes from the most remute times, tracing the snceessive workino of Greek, lannan, and Christian intuences on the legislative and sucial institutions. Some severe strictures on the spirit of worldy agerandiscment, and progressive comption of the doctrin's amb practices of 1 mimitive Christianity apprent in the modern Ioman Cathetic Clumeh, so enraced the ecelesiastical party, that $G$. was universally denouncel and anathematised frum pulpit and altar. The isnorant fanaticism of the lower classes was arousell by the grossent ealmmies levelled at the great writer, who was finally forecd to yidd before the tempest and take rifuge at Vienna. The history was solemmly condemed as heretical and libellons by the peque, and was strictly prohilited. Gr. wats graisted a small pensiom by the Emperor Charles VI., nuder whose domiaion Naples then was, an! received, in stome demree, compensation for his sufferings, in the admiration and sympathy of the enlightencel spinits of his own hanl. In IFint. (i. was deprivel of lis pension and returued to Pinice, from whene: he was ixpelled and furced to sock shelter in trencya. There be composed his famons and bittercst diatribe, contitled Il Thatomo, against the papal petensions, and ered modamed his adoption of the Calvinistic ductrines. Shatly aiter, an cmissary from the eourt of Turin, having artmlly inuratiated himself into the contidence of $G$., impuced him to chater the surdinim states, where ho was immediately arrested and comblucted to the fortress of Tmin a close $\mathrm{p}^{\text {mismer }}$ G. berailed his twIons continement with his chesen stmatios, and retracted his change of relichoms "pinions, a stel whidh in no way alleviated his persecution. H1. dicel a prissmer in the fortress, in 1248 , after an incarceration of twelve years. His son, Cinvaumi, was assionel a liberal lension by the nuw king of Naples, Ion Carlos of Bombon, who thas sought to avert from his house the reproach which overwhelaned the persecuturs and jailers of ons of laly's must illustrious citizens. La storiu Civile has gassed throngh several editions, the most modern is that of Milan, 1503, in 13 rols.. Sro. Sec Corniani: IVita di P. G'itumme du Leontedo Pansini; Storia della Letlerature Italiena da Maffi.

GIANTS AND DWARFS. I giant from the

Greck word gigas) is an indivilual whose stature and bulk exceel thase of his species or race generally.

I'uth the bacimine of the present century, it was uniwersally believed that giants, of a sioce i:cr axeceding thos who are exhibited in our times, furnctly existen, either as nations ur as indwitual specinums. This butici was based (1) on the asserted disconery of colnsial hmman bones; (2) on surposed seripturad evilencer: and (a) on the cribume of vambus aneient and motieval authors.

1 reference to the first mhame of 'invier's Wesentats Foxsilfs will sbew that the bones of clephamte, thinocemses, mastmbus, de., have heen
 gimat. Even so guonl a maturalist ios lintion fell anto this formber "delusion, and figurel the bomes of an ebmbant as the remaius of human giants. 1-idure Geotfing Saint-Hilaire, in his Histoire des Anomerlics do lobromisufion, nutiees several of the must famons of tbere casess. A gigantic skeletan which wats from at 'rapami, in Sicily, in the 1 tthe. was at unce prommonel to be that of the classical giant Jolyphemus, and his heipht was ealculaten at Sill fent. It was pointed out that the bones differed in from as well as in size from those of man, lat this oljection was easily met ly the question: Why, if his lecight was sixty times as great as that of :m mdinary man, shoulik not his form be also diflerent? Mimy less celebrated giants were subseymontly exhmad in icily, and the existence of the
 his liombles of a Heterulist, fully aceoments fur such - lisenveries at an cmoth when fer could recomise the litferences in form letween the lomes of an - Wephant and those of man. J'assing over a giant whone lomes were exposed lay the action of the lihme in 14.an, and whose height was estimated at :0 fent, and ansther whose skeleton was discowere near Lacerne in 1.fic, and who, acouding to the calculation of the learned physician l'later, did mot exceed 19 foct, we come to the case of King 'Sentolmehas, whose remains were discovered near the Ihlome in 1613. by a surgeon named Dazurier, whose Histoive l'critable deb Cinent Teatabuchus. (161s) save rise to a warm controversy. The anatonist liolan imleavomed to expose the innpersture, lat the Parisians mand in erowels to sece the mastokion's lomes. which were reported to have bern foum in a tomb, 30 feet long, bearing the inseription P Tentumelus liex.' Nor have whe own emuntrymen been less eredulons than their continental incichbours. In 1712 , 1 or thather, in the Plitusonhical Tronsections, anmoncal the drscovery of cmommas homes and teeth which had been fomm in the state of New Fork, and which he regarded a:s afforling evitence of the existence of gimats of enormons size in anciont times. The bones were in reality these of a mastodon.

The tripipture evidence, when carefnlly examined, does not amont to momb. The llebrew worls nophilim and !iftorim, which ocear sceveral times in the lionk of "anesis, and which are trinslated ghants, might as well lee transfated beardet. cruel, in simett Then. The leicht of Og, limg of liaslan, is mot siven; we are mily toll the length of his heid: and exchuding his helmet, which was probably taken into accome in the recorded measmement, !anliath, at most, din not exceed cicht feet and a half in stature, and comembently was not taller than sume giants of momeru day3.

The classical evilence is alomiant, but obvinsly untrustworthy. This llutarel relates that ficebonins had the grave of Antans, in the city of Tungis, opened, and finding there his body, full 60 cubits lone, was intinitely astonished, ordered the tun!! to be clused, gave his contirmation to the
story, and added new honours to the memory of the ciant.' l'liny roperts that an carthquake in crote diselosed the lromes of is giant 46 cubits in lenuth, win was held by some to be Orion, and by uthers atus. Descembine to more eftain evidence, there is no donbt that a height of lectween $S$ and 9 foet, and pobally of more than! ! feet, las been attainel. There is a skeloton in the Museum of Trinity College, Dublin, 8 feet of inches in height; that of OThien (or Byme), in the Ahsem of the Collen of Nurtems of lingland, is S fret 2 inches: and that of a giant in the Alsemm at Bom is 8 feet: and the actual holy with the soft parts attaches was probably two or three inches longer than the skeleton. (0'Brien, for example, measured $S$ feet 4 inches after his death, as we find recorded in the Ammal lietpister, vol. xari. p. 209.$\}$

We commonly aply the tem Imeaf to any organised being, lut especially to indivilnals of the human species, whome heght is much less than the average height of their race. Strietly speaking, howner, the worl shomb be restricted to those cases in which there is a general and miform arrest of growth, except, ] whars, in the nervous system, which is often fully deceloped in dwarfs.

The ancients beherel not ronly in dwarfs of extrane minuteness, but in nations of them. Aristotle, the greatest maturalist that purhaps ever existed, declared that the report of trustworthy witnesses testifies $t_{0}$ ) the existence of a minute race of men, with minute horses, living in the caves which are washell ly the waters of the Nile; and Pliny gives varions letails recgarding their halits and their grographical position. Amongst the extreme cases recorded on ancient anthority, we may nutice that of Ihiletas, a poet who was a contemprary with Hipqucrates, and who was ohfiged to ballast himself, to awod beines hown away hy the wint: that of the Eontian dwarf mentioned ly Nicephorus Calistus, whu, at the age of 25 years, dil not exceed a protridge in size; and lastly, that uf the poet Aristratus, of whom Athenems records that his stature was so small that no one could ase him.

We shall now lriefly notice a few of the most remarkable dwarfs of modern times. All the realders of Perril of the Penk are acquainted with Sir Geotliey Hudsom. U1, to the arge of 30 , his heiuht was only is inches: from that age, he ranilly grew to the height of 3 fect ? inches. He hat in enormons heal, and large hands, lont in other ruspects was well proportioned. He died at the are of cij. Count loseph Borowlaski was the son of well-formed healthy parents of the ordinary size, who had six childeen, of whom the tirst, thiri, and fittlo were dwarfs. Joseph, who wote a history of his own life, records that his cldest brother was 3 feet $f$ inches high; then eame a son who was 5 feet ll inches; then eame Toseph himself, whose height at 20 was 2 feet 4 inches, and at 30, 3 feet 3 inches. Ife was succueded by three others, the midele one heing a mil, who thich at 22 of the small-fox, heing then 2 feet 2 inehes, hut of admirable proportions. Joseph Rorowlaski was very well proportioned, was married to a wommon of ordinary size, who hrought him several well-fomed ehddren, anc died at Rank's Cottage, near Durhan, in 1837, at the are of 98 -a seat ace for an ordinary man, and withont example in the history of dwarfs. Niehulas Fory, commonly known under the name of Beble, was another celebrated dwarf. His parents and his Irothers and sisters were all well-formed persons. He was a seven months' chill, and at birth measured less than cight inches, and weighed less than a jromd. When tive yars oll. a physieian, who examined him, reperted that he then weighed

## GIANTS ANCD DUFARES.

9 poumts 7 ounces, and stool 22 inehes hich, but was furmed like a young man of 20 . He did in his oul year, heing then muler three feet high.
 Musema of the loanlté de Métecine of Jaris, thore is a wax-mokel which represents him at the age of J8: and in the Musemm llyistuire Naturelle is his skeleton, which in the eomplete ossifieation of the bones, ant in the disapparance of the eranial sutures, resembles that of an aged person. Areordiner to C. 1t. Carus dsymbolid der intaschliehen ficatalt, Zueite Auhnge, 1838, 1. 8:3), (heneral 'Wom Thumb, the well-known iwar, exhinited alont twelve years ang in this conntry, was 2.5 inches in height, amb Weighed 2.5 ponds; and l'rince Coblobi, a slesvir dwarf, who was betuy exhbiten in Ireshem in 15.01 . was of a similar height and weint, his are being?l yers. ('arus likewse examincl, in the year 1s.7.7. a Dutch dwarf, who took the name wi Tim Thumb. He was aged is at the time of the examination, and then measured about 2 feet $t$ inchas. (These are mobably I'russian measures, which slightly execed those of this country.)

On comparing the date in ompossession regarding giants and dwarfs-and for most of these dufo we must refer the realer to Geoflroy kint-lhilaire's Histoire des Anomuhes-it apuears (1) That giants are of rarer oceurrence than warls: (2) That giants are usually of a lymphatic temperament, and of a very delieate enmplexion, iften deformen, and almost always bably prourtioned; that their museles are thabloy, and their woice weak; while dwarfs are often perfectly well popprtioned, and are strong for their size: (3) That giants are never long-lived-U'liyrne diel at $2=$, Marrath at 20 -while dwarfs seem to attain the fall minary period of human existence-Burowlaski diel at 9s, Hudson at 63; and although we do not know the age at which Therese Souvray-a elwarf deseribed by Virey-died, we lenow that at the age of 73 - elle était encure vive, gaie, hien portant. et dausait à la mode de sou lays:' (4) That while giants usually exhibit a want of activity and energy, amp are feehle both in boty and mind, dwarts are in general lively, active, ant iraseble (Burowlaski in his memins gives a gool illustration of the last eharacteristic, as exhibitel ly the dwarf Beled: - When he purceival that the king took pleasure in my socicty, he conceivel the most violent jualmen and hatred of me. . . and endeavoured to push me on to the fire;' and Sir Cipotirey lludsm's irascilitity is well depieted in Peveril of the Perth). That the intelfectual Inwer of thwars is sometimes eonsiderable, is sufficiently evilencel in the cases of Borowlaski, General Tum Thumb, and the Dutch Tom Thumb, who, aecorling to Carns, spoke four languages.

We know little of the eauses which nceasion the exeessive development or the arrosten aruwth on which the prolluetion of piants and dwaris depents. Bishop Derkeley* is said to have attempted with consideralle suceess to manufacture a giant. IIe took a poor orphan, named Alagrath, and reared him on eertain hygienia prineiples (Virey emjectures that he fed him with mucilasinoms fools and drinks, lint nothing seems known on this point), which were so far suceessful that, at the age of l6, he was 7 feet in height, and that at the time of his death, which occurred, with all the sympthms of oll are, at the age of 20 , he was 7 feet $s$ inches high. If food in this ease did really moduce a giant, why camot our firmers be as

[^6]successful as the bishop? They can ouly produce fatty monstrusitios, not giants.

Croffry saint-llikare lewotes a speeial spetion of his lwok to 'the causes of "dwarfism,' lat he only arrives at the enneral comelusin, that in these cases there is in nistacle to the proper nutrition and development of the fortus: that this onstacle mazy be due either to something women in the maternal orqaism, or mure crmmmbly to sumu disease affecting the fustur itself; and that this disease is usually rachitis on rickets.
 part in the mytholngy of almest all natims of Aryan descent. The creeks, wher representen thom as beimss of monstrons size, with lidemus ennutenamees, and haviny the tails of drakus, placel the ir abenle in voleanic elistriats, whither they were fabled to have been hanished after their misnecesfin! attempt upon heaven, when the conls, with the assistance of Hercules. inprismed thim under Xtua and other voleanoes. Their reputeal orizin, likn tha platees of their abode, luints $t$, the inke of the mysterious electrical and woleanie emondsions of nature, which they olsionsly typify ; and, in acendance with this view, they are saiul to have leen uf mingled heavenly and earthly descent, and to have sumar from the blond that finl from the slam Ourans unom the earth, fie, which was their mother. In the cosmogony of the northern nations, niants ocems a far more important plane than the freeks assignal to them, for here the first ereated lueing was the giant limir, eallerl also 'Aurglmir," or "the ancient Chas, the progenitor if the Frost-giants (1lrimthursar), amony whom dwelt the All-Father befne the ereation of heaven and carth. The monte of origin of Yinir was as follows: In the hegiming of time a world existel in the north, called Nitheim, in which was a well, drercelmir, from wheno issmed a poisomnts stream which hardened into ice', the accumulation of which formeal the northorn part of Cimomengap, ar ahyss of alyseses, whome southern extremity was raliant with the heat aud light which emanatel from another word, known as 'Muspelheim.' 'The meutine of heat and ice producel drops, wheh, thrmug the areney of the same creative fuwir (the All-Pather) whels hal sent them forth, received life ame a laman form. This was Y'mir, wher was hourisheel from four streams of milk, which liowed from the cow Authumla, or the nourishinn-fower, which hat Deen created hy surt, the Enariman watel of Muspelhem. While Vimir slept, a man ame woman yrew from unler his left am, and a son was promed from his feet. In enurse of time, wher leings were generated from the salt and frosteovered stanes whicla the cow Amhumlit lipki, and from these were lom these hrothers, Glin, Tili, and Ve, who were tods, and who, laving slain I'mir, and dracsell him unt into the middle of (imnongagay, formed from lis homd the spa and all waters, and from his hust hody heaven anel eath and all solin thing in nature.

With Yuir perishell all the frost-giants exeept Pervelmir, who, with his wife, escapel on a chest or drum, anl lecame the father of the now giant lynasty of the Joiturs. The gods formed, howevir, of the evelrows of Imir, a wall of defence arainat these giants, who thenceforware dwelt in Jutunheim, heyond the bombaries of the aeean, which eneireled Milyarl, the future abrole of the sons of men. The Esir or genls livel in their own eity. Aspard, necupying themselves with works of industry till they were computed ly the giantesses who eame to them from Jotunheim, when the Gomden dge ceasch, and discord arose among the gods. At the instigation of the maidens
from dotumbein, the gols created dwarls and men; tha fommer from the magrots gencrater within the fonly of limir, and the latter from trees; and from this time the giants manlually lust their power, muter the united oprosition of grods and $\mathrm{m} \cdot \mathrm{m}$. In the phoular belicf, common in all countries, that through the agency of giants momtains and islands have arisen, and rocks and monntans have been hurled from their original sites, we trace the indeal personitication of the forees of nature, which, after lons periods of inert repose, exhifit sudden and uncontrollable outhursts of riolence: tims giants were represented as good-humonred and complacent When at rest, but implacable, sarage, an? treacherous when excitel; while they were at all times impressed with a consciousness that, notwithstamdins their luge lukk, and the excess of loanls and arms with which many of them were gifted, they were but stupil monsters, malle to cope with the realy wit and keen intelligence of divine or even hman beimes, to whom they believed it was the decree of fate that they must ultimately succumb. In this ruspeet, the giants typify the heathen clement in its condict with Christianity, and northern saras are rife with the histories of gigantic, will, and eruel races, known as Thursar. (troth. thaursjan, to thirst, or Jötnar; AngloSaxon cten, to cat), who ate and drank voraciously, and subdued all things to their sway, until there came from the far East a people, who knew and worshipped the god of the universe under the name of the 'All-Father,' and who, ly their greater skill, overcame the sarage giants of the north, and compelled them to withdiaw more and more into the recesses of the forests aud mountains, whence they only emerged from time to time in the form of mountain trolls and giants.

The duoaros who nigure in the Eiluts as cunning and crafty elves, skilled in magic and in the working of metals, are conjectured to have been a race of Oriental Lapps, who immigrated into Sweden aud Norway later than the Jinns, who were the descendants of the giants, and therefore the oldest of the races that now occupy the seandinavian peninsula. When considered under the broadest sigmincation of the term, twarfs (Groth. drairgs, which Grimun conjectures may be ideutical with the Greek throurgos, one who does sujernatural works) typify the transition from inorganic to organic nature, and thus personify the subordinate powers of atme; amm under this idea they are represented as assisting men ly combining the primary ores into new mineral budies, and fostering the development of fruits and seeds. Considered from this point of view, they oceupy an intermediate position loctween giants and men; and while they fear both, they meline to scrve the latter at the expense of the former, and thas appear under the form of bencficent clves (!. v.), fairies, and brownies (q.v.). During the latter part of the middle ages, when the traditionary folk-lore of Western Ewrone was heing supplanted by the literature of the monks, which consisted mianly of legends of saints, the devil and the fatlen angels took the place, in the minds of the illiterate, that had hitherto heen occupied ly giants and dwarfs; and the various superuatural feats of strongth which had in earlier ares been ascribed to these imaginary beings, we:e attrimoded to satan aud his attendant spirits, or in some cases to the saints of the chmreh.-See Grimm's Dentache Mythologie, "Thorpe's Sorthern Mythology, Grumitvig's Nordens syythologie, and I'etorsen's Nordisk Mythologie.

GLANTS' UAUSEWVAY (deriving its name from a mythical legod that it was the commencement of a road to be coustructed by giants across
the chanmel tor Scotlanl), is a sont of pier or mole, of columnar lasalt, projecting from the northern coast of Antrim, lrelanol, into the North Channel, aloont 1.) miles from (whaine. It is part of an fextensive and overlying mass of basalt, from 300 to 500 fect in thichiess, which covers almost the whole county of Antrim and the eastenn part of Londonderry, extending over an area of mearly 1200 siluare miles. T'he hasalt oceurs in several betls, interstratilied with layers of ash. It covers secontary strata, convorting the chalk into granular limestone, and the lias shale into Lydian stone, where it comes in contact with them. Several of the basaltic beds are more or less columanar, but three layers are remarkably so. The first appears at the bold pronontory of lyair llead; its columns are coarse aud large, cxcecding su0 fect in height. The other two are seen together rising above the sea-level at bengore Head. The lower one forms tho Causeway at the place where it is uncovered, as it again gradually dips under the sea. It is exposed for 300 yards, and cxhibits an unequal pavement, formed of the tops uf polygonal colamns, fitting so compactly that the blade of a knife can seareely be inserted between them. The columms are ehiefly hexagonal, though examples may be found with 5 , 7,8 , or 9 sides; and there is a single instance of a triangular prism. The thameter of the pillar is very variable, but the average size is from 15 to 20 inches. Each pillar is thivided by joints of unequal length, the concave hollow at the end of one division fitting exactly into the convex projection of the other. "Ihe rock is compact and homogencons, and is somewhat sonorous when struek with a hammer.

The Cinseway is divided into the Little, Niddle, and Large Canseways. The Large Canseway, which is formed by the lowest of the three columnar beds of loasalt, is abont 30 feet wide, and runs more than 200 yards from its exposure on the cliff till it is covered by the sea. The Little and Middle Causeways are formed from the second colnmuar stratum, and are less remarkable than the other.

GIAOUR, a Turkish word, corrupted from the Arahic hiafir ('unbehever'), and applied by the Turks to all who reject Mohammedanism, especially to Emopean Christians. Though at first used exclusively as a term of reproach, its signification has been since modified, and now it is frequently employed merely as a tistinctive epithet. Sultau Mabmid Il. Forbade his subjects to apply the term (r. to any Luropran.-G. Was the title of a poem written by Lord Byron, and pmblished in 1513. Compare with $G$. the word Guebres (q. r.).

GlATENO, a town of liedmont. stands on the left lank of the torrent Saugone, 17 miles west-south-west of Turin. It is surrounded ly walls, and possesses a castle, erecter? in 1369 by the abbot of the monastery St Miched della Chinsa. In 1003 , Vhan 11., Count of Savoy, endowed this abbey with the lands of $(x$. , which, however, owing to the unproductiveness of the soil, were not ot great value. 'l'he town was formorly a thriving commereial place, with a eonsiderable trade in linen, leather, de. It still possesses some maunfactories of linen, cotton anil silk stulls, besides tanneries and iron forges. Top. 914.

GLDBON. EDward, the historian of The Decline and F'all of the Roman L゙npire. was born at Putney, on the 97 th April (O.S.) 1737, and was the first child of Edward Gibbon and of Judith I'orten, both of good family, and the only one of seven children that survived infancy. Memoirs of his Life cend Writings were witten by limself, and these, with

## GIBBON.

his letters and other miscellancous works, were mblished after his ateath by his friemt Lord sheffield, with whom he had long carried on a most confidential correspondence. Few autobiographies are so interesting as that of G., and none more veracious. It is a self-portraiture, both in regard to what is said and in regard to the manner in which it is said - his pride, self-complacency, inturrity, and contempt for the contemptible, and much lesule. bem all elearly revealed as proposed by him with 'truth, makel unblushing truth.' He retlects: "गly nane may hereafter be placed among the thonsand articles of a Biographia Britamica: and I must le conscious that $n$ one is so well qualifiod as myself to describe the series of my thoughts anl actions.' s in his 5od year, after be had finished hiss "arduous and successful work,' he proccedel to do it. Like most thinkers, his actions were few, and arart from his thoughts and the growth of his mimd quite unimprant. He spent a sickly chaldhood in occasional lessons and elesultory readiug and discussion with his mother's sister, a lady of a strong understanding and wann heart. whom he calls 'the mother of his minl,' and to wluse kime. ness he ascribes not only the bringing out of his intellectual faculties, but the peservation of his life in these critical early years. One of his tempmary masters was the Rev. Philiy, Francis, the translator of Horace. His father, who seems to have been the somewhat impulsive pussessor of the wreck of a fortme, had him enterel at Maglalen College, Oxford, at the age of 15 , when low was very imperfectly prepared for this crisis; his extensive reation and interrupted education having producer 'a stock of erudition that might have puzzed a doctor, and a degree of ignorance of which a sehool-boy would hare been ashamed.' Here he spent 14 idle months, the chief result of which was, that in his incursions into coutroversial theology he became a convert to the Church of Rome, and found himself shat out from Oxford. He was ly his father placed under the care of Mallet the preet, and a deist, but by his philosophy the young enthusiast was 'rather' scan. dalised than reclaimed.' 'lo effect his cure from popery, he was sent to Lausamne, in Switzerland, to board in the house of M. Pavillarl, a Calvinist minister, a poor lut sensible and intelligent man, who judicionsly suggested hooks and argunents to his young clarge, and land the satisfaction of secing him reconverted to Irotestantism, in witness of which conversion he receivel the sacrament in the church of Lansanne on Christmas-lay 175. his belief in popery latring lasted nut quite 18 months. He lived nearly five jears in this house, respecting the minister, and enduring with more or less equanimity the 'uncleanly avarice' of his wife ; ant it was here that he began, and carried ont steadily and joyously to an extent that will astonish very hard students, those private stulies which, ailed by his enormous memory, mate him a master of crudition withont a superior, and with hardly an equal. Here also he fell in love with Mademoisclle Susan Curchod, the daughter of a clergman, a young lady beatiful and leaned, who afterwards became the wife of M. Neeker, the distinguished French minister and financier. G.'s father disapproved of this alliance, and he yielded to his fate. After his reiurn to England and his father's bouse, the persevered in his studies as he hest could.

He fimsked a little work in French, legmin at Lausanne, and published it under the title of Essais, sur l'betule de la Litterature in 1761. In the same year he became eaptain in the Hampshire militia, in which he continued for two and a half years. Of this part of his career he observes: 'Tbe discipline and crolutions of a moderu battalion gavo me a
clearer notion of the phalanx and the legion; and the eaptain of the Hampshire grenaliers (the reader may smile) has not leen useless to the bistorian of the Joman limpire.' 'The militia beine disbanded, be revisited the continent, and traveded into Italy; and amony the bencits of foreign travel, he notes its influence in sugsenting the work of his life in these worls: 'It was at lime, on the l5th of Oetuber 176t. as I sat musing amiket the ruins of the Capitol, while the lareforted friars were singing vespers in the temphe of Jupiter, that the idea of Writing the decline and fall of the city dirst started int., my minul.' llis plan, origiually circumscribed to the decay of the city, gew by years of realing and retlection and delay t" embrace the empire. During these years his father died, leaving his atlairs doranged, and be catered parlianent for the borourh of Liskearl at the burinning of the strugule with Amorica, 'and supportal with many a sincere and sident rate the rights, though mot, perhaps, the imerest, of the mother comotry: Ite sat equth years, but never had comrage to spaks; "the arcat speakers thlled him with despair, the bad ones with terur.' $\ln 1760$, the first volume of The Dectine and Full was pullishoel, and its success was prodions, The repatation of the anthor was established lofore the religions world had had time th consider aud attack the last ehafters of the work -the loth amb 16 ch -in which, while almittiner, or, at least, not denying, the conrincing eridence of the ductrine itself, and the ruling jrovidence of its great author,' he proceds to account for the raphl growth of the early Christian church hy 'secomdary' or human causes. Hume, who was then slowly liying, in a lighly complimentary letter. told him in resard to these chapters: '1 think you have olserved a very prudent temperanent: luat it was impossible to treat the subject so as not to give grounds of suspicion against yon, and you mang expect that a clamour will arise.' The prophetic criticism was correct: the grounds of the "clamour' beins, at the best, only strone suspicions that, in hecoming a convert from Popery to Protestantism, Cribon hidd, like I'ayle. rone on "to protest auainst all sects and systems whatsonere.' That he did not like to see the barefooted friars in the temple of Jupiter is clear enough all thongh the six lare and comprat volume's of his history. Ile tinished this great work on the 2 -th Jume 175 at Lausame, to which he hand retired for quict and comomy after leaving parliament, and holding offiee under government for a shirt time. In lis Memoirs, he tells the hon of his release from his protracted labours -between eleven cielock aud midnight-and records his first cmotions of joy on the recovery of his frection and the sober molancholy that succeeded it, all in a style aml in a connection which, with much lieside, must be studied in his own pages by those who wonld know (ilbbon in his real greatues: self-complacency, egotism, and contemplative sad. ness. The lady of Lori sheffield, his close friend, havine died, F . left Lausanne for England to cousule him: and about six monthe after his arrival, he dich without apmehension or suffering, on the lath Jannary 1794, in St James's Strect, London, of an chormous rupture and lyylrocele, which, as it gare him no pain, he hat allowed to grow neglected without sperking of it to either friend or physician for thirty-two years.

In persoa, C . became very corpulent, and the small bones of the ligheaded delicate boy were in after years hardly adequate to sustain their lowd. Vauity was, perhaps, his only frailty. He affected the manners of the time gentleman of last century to the cul, and they adjusted themselves grotesquely to the unwieldy body and the massive mind.

It is not ensy to charactorise in man of sogigantic and cultivaterl in intelloet in few on many phrases. IIe was a faithínl fricud, pleasant anil larally rivalled in comrarsation, mot dislikel lye any one who wanc new hins. ## GIPIALTAR.

fatal. Oi late years, the energetic measures adopted hy the enginerr-oticers to improve the drainage of the town have, coupleil with stringent poher regulations, dreatly diminished the death-rate: ind C . is as renmarkable now for its cleanly aplearamee as, nep to 1814, it was celebrated for heing one of the dirtiest towns in Europe. 'The place is, however, subject to a periodical risitation, once in twelre years, or thereahout, called the G. fever, an epi. demic which works sal havoe among the trools.

There are no springs of incesi water on the rock, ann the indalitants are therefore monpelled to depond on the rain-fall. In consequence of this. every precaution is alonated to preserve as much of the water as possible: tank: are fed sustematically hy the drops enllecterl from juvate roofs, and conduits are made fo guide the trainage from the rock suriace into grat puhbe reservoirs. Among the latter, the Navy 'lank, for the supply of ships coming to the prist, is conspicuons, its
capacity being from 9000 to 11,000 tons of water large strues of main are maintanet in ease of slege; but the prinsula does not protuee sufticient food to furnish current sustenance for its population. Provisions in phenty can, howerer, te procuren at a cheap rate from the opposite African shore.

The low of Algesins or Gibraltar. is about S miles long by 5 lroad, with a rlepth in the centre of upwatis of 100 fathoms. The anchorage, however is not very good, and the bay is quite exposed, especially to the south-west winrls, which sometimes flrag the ships from their anchors and drive them ashore.
G. has been knomn in listory from a very early perint. The Phonieian mavigators called it Alube. which the Grecks corrupted into Calpe, its classical name. With Abyk (now Centa) opposite, it formed the lillars of Ilerenles, long helil to be the western bonndary of the worle. It is impossible to doubt

Luropa Point, Gibraltar.
that such leaders as Mannibal and his fellow-Carthaginians must have been arake to the importance of this rock in their expeditions from Africa into Spain; but we have no certain information of its natural strength being made availahle for lefonsive or acgressive purposes until the year 711 A.D., when the saracens, passing into Spain under Tark lbmZeyal, a general of the Calif Al Walid, fur the conquest of the Visigothic kinglom, fortified it, as a base of operations, and a ready puint of necess from the Barbary coast. From this chieftain it took the name of Gobel-Tarik, or Mill of Tarik, of which tribraltar is a corruption. One of the ohd towers of this early castle still remams. Sulbequently, f . shared in the revontims among the Noors of spin, heing now in the hands of Almoravide prinees from Afriea, and again in the purer of mative Arab monarelis. In 1309, after a gallant defence, it sucemmbel to the Christions of C'astile undel Don Antonio de Guzman. The king of Castile immediately constructed additional works and a dock-yard at the 'Ohl Mole,' and also thek measures to induce a Christian population to settle in the town. The Moors besieged ( r . in 1315 ineflectually, but in 1383 it fell to the army of the king of Fez, whom a siege by the Castilian monareh failed to thislotire. In 1400 , i46
0
the Spaniards tried once more to take the stronghold; lut they were unsuceessful, until, in a snl). sequent sicge in 1462, the place was captured throngh the treachery of a renegade Noor. From this time the Moorish power was too thoroughly broken for any scrious attempt to be made for the recuvery of 4 ., which remained in the hands of the Spanish, and was so strengthened by additional fortitieations, that the engmeers of the 17th c . accountef it inspregnalle. A combined Duteh and English force, however, under sir George Rooke and the Prince of Hesse Darmstailt, demonstrated that $G$. could be taken ; for in 1704 after a vigorous lombardment, and a landing in force, the governor deemed it wise tu capitulate. How great, even then, were the caprabilities of the rock for defence is seen from the fact that the garrison, only 150 strong, Ihacel 2.6 of the Einghish hors-le-combat before ther surrentered.

Sinee 1704, , has remained continuonsly in the possession of thu Pritish, but not withont the necessity of their resisting many desperate efforts on the part of Slain and France to dislodge them. Before the victors had been able to adtl to the defences, their mettle was severely tried by a siege in 1704-1705. In 1720, it was threatencd, and in 1727 actually attacked by an overwhelming force under the Count

## GIPRALTAR.

de las Torres. Ihuring this siere, the place was near falling into the hands of the assalimes. The must nomorable, howerer, of the sieqes to which G. has been exposed, commenced in 177!, when Britain, beiner engaged in the strusegle with its revolted colonies, and at the sam: time at war with France, spain trok the "pportunty of joining the coalition, and thrected her whele strength against the isolated garison of this small but redoubtable fortress.

The commmications with Spain were closed on the 21 st June 1779, and a strict blockad.e established by the Sprnish flect; the strength of the leesiegen force being at this perion 53s:2 men, incluting 1093 Hanoverians, und rencral Eliutt, the ensernor. Famine speedi]y set in : the comem [misheid forwand lis works for the future bonnbardmont, and eommenced active annoyance on the 12th Janmary 1780, by firing several shots into the town. live days later, Amiral Roduey overemue the spanish admiral, threw a good supply of provisions into the fortress, added 1000 men th the garison, and, remoring all usele'ss months, left it dependent on its own strength. Wuring 17 - 0 little of importance happened: scurvy disabled many of the defenters; the hesierers adwanced their works, contimually inereasel their foree, and by obtaining possession of the opposite African ports, cut of the last chance of rovisions being obtainel for the stronchohl.

In Appil 1781, starvation stared the British in the face, when, on the lath, Achmiral Darly couvoyed 100 merchant-vessels into the hay. The Spaniards instantly opened their fire, bonnon to reduce the debilitated garrison before eflectual aid mas recoived. 114 pisees of artillery, inchuting 00 13-inch mortars, pured their deadly missiles into the blace: for many days this lombardment lastel with unatated rigour, and, though less ineessant, it continued without intermission until the 2bth November, when, in a desperate midnight sally, the British succeded in destroying the more advaned of the enemy's lines, in scting fire to many of his batteries, anl in blowing up his principal ileput of ammunition. This daring enterprise, successfully carried out against lines mountins 10.5 guns, was attended with surprisingly small loss, and forms one of the most brilhant incideuts in a mornificent defence.

After this repulse, the Spaniaris ceased severe hostilities for several days, up to which cessation the garrison had been incessantly bmanded for nearly cight months, and had had 565 officers and men phaced hops-le-combot. The siere contimud, however, thromgnt the winter and sping of 1720 without any remarkable incintent. In July, the Due de Crillon took commant of the asialants, and preparations were made for the grand assanlt. Adlitional battories were comstracted on the landside, and dhatin: batteries built fin this special siese to batter the furtecss srom the sca. The latter consisterl of ten larie vessels, whuse sides were fortified by seven toct of timber and other materials supposed to he olstructive of shot; they were covered by shating shot-pmof ronis, and were intented to be moored by massive chains within lalif-range of the rock. Covered boats, destined to disembark 40,000 troops, were at the same time prepared. The effective force with which General Ehiott had to withstand these eflorts comprised, with the marine hrigale, about 7000 men .
The great attack commenced on the Sth september by a hombardment simultanconsly on all sides; a line-of-battle ships poured in their broadsides; Is gun and mortar boats approached the town; while, from the Spanish lines, 170 pieces of orTnance of large calibre opened in one magnificent lischarge.

This terrific fire contimual till the 12 th ; wheu the combined French and spanish ileetz, numbring 47 sail of the line. the 10 batterins ships mentional above, ostecmed indestructible, with many fricates and smaller ressels, anchored in the lay of Alye. siras. On the lith ewry gun of hesiecters aml besieged was in phas. 'Tlwe battering vessels provel, as anticipated, involnerable to shat and shefl. At noon the enemy depressen their guns and dial much damage: and the defembers than resortal to the expedient of rem-lyot halls. These, with carcasses, and incembiny shells, were concentrated on the batterine shins in unceasing volly's. suceess was doubtinl for some hours, lat towarls evonins the giqantic eflorts of the lritish force bean to produce fruit. The slip of the spaish almiral was in dames, the secome in command was semm moter ofl, and athourt ly ciuht riclock the attackior sumarion was inmpletely silenced, the fire of redbot shout was eontinuad without intermission till murning. Ey 4 A.M. on the 1-lth, eight of the batterime shijs were on dire. In short, of the ten invincule battoris, every one wis timally harned; the Spmiands lost at least 2000 in killed aloue; amil the matal attack was completely repulsed with a loss to the heroic garrison of only if killed and tis wommed. It is worthy of record, that notwithstanling the fury to which the lirtish sulliers were wrought, brigadier ('urtis, with a devoted banl, made gallant aml successful ellorts to preserve the poor follows who were leit by their affrighted comrules to perish in the burning hulks.

The great bombadment of the 13 th September 178. was the crowning trinm of the sleqe: lut the firing contimusl in a harassing degree from the Spanish lines, until the od Felmary 1753. When the Duc de Crillon, as much to his mwn as to Creneral Eliott's satisfaetion, amonned tha conelnsion of peace. The spanaris welecmed their hate encmís with the enthasiasm due to heroes. The thanks of parliament were cordially awarded the gallant Dand: while brave General Lliot recrivel the deenration of the bath, aml sulserpuently the tithe of Lord Ifeathtich. Sore space has been allowed to the descripion of this momorable strugute than we cin ordinarily spare to specitie wars: lut the glorions flace it ocrupies in Fritish ammals, the Tencth to which it extemeled (i3 years. 7 monthes, aml 12 ilays), the dispmity of force, the lribliant dufenee, and the compratively small loss of the garison$3: 1 ; 3$ killed, $5: 40$ dien if disease, 1009 wouded, and 4:3 duserted-sum to point $t$, this the last sieqe of $f$. as and explint nut to be passed over $l y$ a mere reference.
sinece 1-S3, the Pritish prosession of G. has Ineen mmobestem, and fow events have happened of any interest, apart from the genemal history of the empire. At present, linglame guards this formidale rock with jealons care: every available pint for defence bristles with artillery; the momitain is honeycombel with adleries and hmon-proofs, stet pescarps har all inproach, and batteries hewn in the solid stone, frawn alike on fricul and foe. Immense stores of provision, water, and monitions of war are enstantly maintaincel; and the whole is gartisomed by a thoronghly efficient force of alout 5000 infantry, with loma irtillery, and a smatler body of engincers. The jealonsy for its safety would appear to rest mother on makiue its preservation to the crown of England a pint of honour than a matter of national importance, for beyond being a standing menace to spain, and is source of constant intation, it is riflicult to see its actual use to Great Britain. The hartour is not of great value, and the furtress by no means commands the strait.

With regard to the internal organisation of $G$.,
the law of Encland prevails: tho gexernor's decisinn lwing tinal in civil cases mot involving more than exalo. In mope impertant canses, an apral lus tothe British I'rivy ' 'auncil. There is at trond pulice foree, und w a police masistrate, and dolerable order usually proals. All religions enjoy a procet tolecation; the ("atholics are most momorous, hating a hishon and a cathentral : moxt the Jows, wha pussess jour symangus; the l'mostants, though bus mumerna, have also a hishom. There are three grun publie horaries; the best and uldest lowin that started hy the famons Colenel briakwater' the historian of the great siede.
( x , is a free purt, and a resort in consequence of Spanish smogeles, who drive an anazing trade ley introlucine contraband poods intor Pran. Thie lintish wermment is net altorether tree from a chame if hreach of faith, in the toleration it has given to these dislonest men: for it is lomm ly many engagements to use its liest exertions to ma vent any frand on the spanish revones, in consefuence of its pussession of this peninsula. The culuy of (t. was for many yens a most costly one; but of late, hy judicous manarement, it has beell mate to defray the expenses of its cwil government; the henvy charge for the military force being, of course prable out of imperial fonis. The revione amomits to alout $\$ 30,(000$, and is derived from customs, furt and fuaratine dins, land revenues, stamps, anil licences. Its erst to this country over anl ahme the rewouse collected, is computed for the year 1862-186:3 to le $\pm 300,000$.

The town of 1i. consists of three parallel streets, in which the curious intermingling of English arelitecture with the Manish houses spoils the effect of the whole. English domestic Imihling is animently unsuited to a climate light anel hot, like Gibnaltar. There are, nevertheless, some handsome structumes.

GIDRALTAR, Smpats of (ancintly the Staits of Iferculen), extend from 'GuM Spartel to ('ape Centa on the African coast, am trom Cape Trafalgar to Eurona Point on the coast of riain. The straits narrow toward the east, their width leetween Shoph I'oint and Cape 'certa bing omly 15 miles, whild at the western extremity it is at miles. The lenglh (from cast to west) is abont : if miles. The tille at Tarifa rises from 7 to 8 feet. Throngh these Straits a contimal eurrent runs from the Atlantic, and is so strouy that sailing vessels bomel westward can pass only liy the aid of a bisk wind from the Levant. It is surposel that the waters of the Anditerranear find an outlet here by an melercurrent, as well as ly the currents which flow westward along the Laropean anel African shores respectively:

GlBSON, Jomin, one of the first senlptors of the day, was horn at Comway, in North Wales, in 17:1. His father, a ladseape-garlener, removed to Liverfun about the begming of this centmry, and here (: received his education. Ilis love of art manifested itself strongly, even while he was a mere boy at selowh, ame at the age of 16 he entered the marble works of the Messis Francis, by whom he was introdheed to Jiscoc, whose art-treasures were placed at his surviee. 'Through the kinchess of some wealthy friemets he was enalider, in his Beth year, to proceed to lonae, where lue hecame a papil of (anova, and after his death of Thomwallsen. (1. then fixed his resinhnee in that enty, and very schom revisited his mative conntry. His tirst reaprearance in England was ifter a lapse of 28 years. At lirst, ${ }^{\text {b }}$. shewed himself, naturally mongh, it faithful follower of Canna, whose graceful sottuess he made his own. lint be did not stop, there, liy the stmly of
the anticur, which Thorwaldsen was the very man tu) stimulate. (a, timally ruse to ideal purity, and a theroush realisation of the grace of form. This alvane is clearly traceable in his works. Ilis tirst impurtant work was a 'Aymp unfastening her randial.' This was followed by a grompropesenting 'l'syene borne by the Zephyrs,' which he executed for sir foorge Beammont, and which he several times repeatel. In the church of st Nicholas. in Liverpond, there is a leaserlief of (i,'s representing a traveller combucted on the dangerms $1^{n a t h}$ of life by his guarlian angel. Anong lis greatest works are his Amrora rising from the Waves to annomee the lay' (belonging to Lort 'Fownshent); "The Wountiod Amazon' (the property of the Mitrquis of Westminster) ; 'The Ihmur am his Doy;' ' Narcissus,' 'Helen,' '大appho,' Proserpine.' and 'Vemus.' A spinit of the finest puctry lreathes through these works:-they are thorunghly classical, and are marked ly a retined aud noble severity. His grand inmonation. lowerer, viz, that of tintin; his figures -though he lefondel the practice by a reference to Grecian precelents-excited much lieen controversy, amd camot yet be said to lave commended itself to the pmblic taste. Among his $\mathrm{l}^{\text {mortrait- }}$ statues, those of Huskisson and Peel, George Stehensen, and Quen Victoria are the best. (i. was clected a member of the lioyal Acalemy in 1836. (He dim Jannay 1866.)
 politician and statesman, only son of Major MihnerTibsom, was lena at Trinidad, 1807, and edneated at I'rinity College, Cimbridge, where he took a wrangler's durre in 18:31, Jle entered parliament as M.l'. for lpswich in 1837 , on the Conservative interest. As his political riews expanded, he threw ofl his allegiance to Sir Fobert I'wel, for which be paid the pemalty of the luss of his seat in 1839. In this year he assumed the mane of Miner, hy royal licence. His cloquence, ahhility, aud superiority to party-tios having gainel for him the confidence of the Liberals, in $1 \$ 41$ he successfully contested Manchester against the Conservative candidate, Sir G. Anrray. He had previously distinguished himself by lis advecacy of frecetrade: and chang the sueceeling five years, oceupied a prominent position, both in and ont of parlizment, among the orators of the Leaus. When the measme for the repeal of the Corn Laws was rarried, and the Whigs came into oflice in July 1816, he was mate a priry comocillor, and riep-presilent of the Foard of Trale: but, in April 184S, gave ul a post which was by no means commensuate with his frowers and pretensions. More and more identifying himself with the opinions hed by Messrs Coblem anl Bright, when the war with Pussia hroke ont, lie esponsed the umpopular doctrines held ly what was called the "Dlanchester school', or as it was "therwise desig. nated, the 'Ieace party.' In 1857, the Whiss and Conserratives of Manchuster sucessfully united to unseat him ant his colleaghe, Mr Liright. Niluer-(r. was, however, returnel at the end if 1857 for the borongh of Ashton-muler-Lye, which he has continumd to represent. In 18is. he mored an amendmont to the second realing of the Conspiracy bill, expressing the ahomence of the House at the attempt by Ursini non the life of Napoleon III., and its realiness to smend defects in the criminal law: but consming the fow ermment for not replyins to 'rome l'ersigny's desintch of Jamuary 20 , 18.5S. The anendment was carried, and the government of Lord I'almerston was shattered to pieces. When that moble lord again took oflice next year, he rengused the skilful $\mathrm{p}_{\text {mrliamentary-tactics and }}$ influence of Nilner-C.. by oftering him a place in his cabinet. Be beeane ch-interim president of the

A inotice of lis life will be femm paetixal ly the calitus to the Sth vol. of his Church IIIstury.

Gif'SSEN, the principal then of the forince of IHer Hesse, in the liramdinchy of Hesme, or Dlesse. barmstadt, is $I^{\text {leasantly }}$ sitnated in a beautiful and fertile plain at the contluence of the Wieseck and the Lalm, 34 miles morth of Frankfurt-on-theHame. Pap. aboat !uono. It is chictly desorvin. If notice for its well-endoned university (founded in 1607), which prissesses conmmotimes lmilalings for lecturing, aus has well-apmontul anatomeal and other mascume, a gool himary, observatuy, a famous chenical laboratory (where the illustrious Liehig experimented), hotanimal ganken, \&e. There are alser varimes endowed schots, as the Gymnasium, Feal-schule, \&c.. anl sereral institntions for the preliminary instruction of dificrent branehes of merical knowletge, which are connected with the university. G. has maunactories for the

## GIFFORD-GIL.

preparation of tobacco, licueurs, vinegar, soap, and leatler, anl is an active thriving town.

G1FNORD, William, an English poet, translator, and critic, was burn at Ashbarton, in Devonshive, in dpril 1750 of the age of 15 he was apprentiocul to a shommaker, hot exhbitine a very decind hias towards learning and pretry, he was enabled, throuth the lindmess of sume frients, to acquire on ealucation, and to procend to Lixeter Colleare, ()xforl. ( i ,'s first pulbication apmared in 1794 , being a satirical poom, entitled the buriud, directed
 them in a moment, like the fall of a rock. Flushed with success, (i. next Jear proninced the Soratil. which satirisel the othenees in the high places of the hama. In his thime satire, (r. assailed $P^{\prime}$ eter Pimbler ( $\mathrm{D}_{\mathrm{r}}$ Woleot); anel the coarse and witty woutor, the lureath of whose mustrils was literary warate, rusherl to the fray with $A$ G'ut at a Cobuler, and lespattered his oppuident with mud from the kenucls. Camning and lis friends haviner at this time set up the Anti-dacolin, G. was appointend wlitor, and through the influmee he acquired anoner the leaders of at least one section of the political worle, he was appointed to ottices, the joint cmolitments of which amommed to $t 000$ prommu. In 1502, he transhated Jueome, and aprevded to his work is sketeh of the poet's life. Me edited the worlss of Massiuger, Forl, Shirley, and Ben Jonson, and in his motes assailed fomer alitors with the intmost ferocity. In 1808 , he was appointed cditor of the (puarterly Fieciew, started by Nir Walter Scott and his friends in opposition to the E'dindargh. The periodical under lis charge attained great inflnence, and he contimued his clitorial duties till within two years of his leath. He lied in London on the 31 st I Pevmber 1826.
G. possessed much satirical acerbity and poison, but as a poet he hohds no rank whaterer. As annotator and editor of the old English diamatists, he did goon sarrice, but his lalooms in this tield are disfigured by suspncion and walignity, As a critic, he was liitterly partial aud onc-sided, and his praise and hane ilependel on the political leanings of the writer. Leigh Hunt was to le pursued like a wild-beast, lueanse he was a Liberal; and the flower-garden of Endymion, every rose of which was feal by the dews of paradise, was to be trampled upor with erition hoof, becanse licats was known to have waitten a sommet in fraise of llimt, and was mukerstond to be his private fricm. G. had bed rudely nurtured; he lived in a time of rreat political uncharity; and if a portion of the litterness be displayed may he sct elown to natural disposition anit turn of mind, the largev lart, perhaps, mast be exhlained by the pressure of the times in which be lived.

Gint, in Enolish Law, means a gratuitous transfer of property. Any lerson is at librety to do what he pleases with his uwn property, and to give it away with or withont consideration, if he is so inclinel. When be gives away goorls or chattels, mere dilivery of possession, aceonpanimd hy words of gift, is sufficient to transfor the moperty; and thea the transaction is irrevocable. Bhat if he dues nut give possession of the roods at the same time, theu, in orlar to be hinding upom him, he must execute a deel ur writing utuser seal. The reason wit this is, that a mere verbal promise, without some lural consieleration, is nugitory anl revocoble; whereas, wher he executes a lived, he is stopped from ever afterwards deuying it. Where the property given is not personal, hint real, then a deed is in general alsolntely necessiry to transfer the property. it will is the wost familiar example of
a gift of property lonth real and personal, for the testator geucrally, in such a case, gives away his moperty gratuitously. Each gift of personalty by will is better knowis maler the mane of a legacy'; anm a gift of lami is generally callen a devise.

As sometimes the power of giving away property gratuitously is abosed, in onler to defraud and ilefeat creditors, it is provided by statnte, that a voluntary conveyance, whether of chattels or land, mate by a person who is at the time insolvent, shall be roil as against such creditors; and they are entitled, accordingly, la recovel the property from the donee ( 13 Eliz. c. 5). The gift, howerur, even in such a case, stands groul arainst the donor himself. So, if auy person give by deed gratuitously any land, and then sell the same land, the gift will be void against the bond-fde purchaser ( 27 Eliz. c. 4) :

There is a peonliar kind of gift, or rather a gift made in peculiar ebonmstances, called a Donatio Mortis C'ausu, i. e., a gift made by a person on death-bed of some personal property, such as chattels, money, bills of exchange, de. Snch gifts are held good, if they comply with certain conditions. This is in sulustance a morle of giving personal chattels to a particular indivilual, without the necessity or intervention of a will ; but such gifts are so often afterwarls disputed, that it is better to incinde them in a will.

In Scotland, a gift may be made of goods in the same manner as in Fingland; lint it is usually called a Donation ( $\mathcal{F} . \mathrm{r}_{\mathrm{r}}$ ). Gratuitous aliemations hy persons in insolvent circumstances are also held to be void as against creditors (stat, 1621, e. IS). Thongh it is competent in Sootland to malse a gift of goots or moncy hy merely helivering the possession thereof, aceompanied by worls of gift to the douce, still there is this pecmliarity, that if the transaction is afterwards impeached, it cas only be moved in Seotiand by the donol's writ or oath, no matter how many witnesses may have been resent; whereas, in England, it ean be proved by ordinary witnesses, like any other fact.

Gift, in the Libw of Scotland, is also often usel to denote a grant or aprointment ly the crown or a court, such as gifts of non-entry, escheat, hastardy, tutory \&

GilGG, GICA, or GIGEE, the name of a short piece of masic, much in roune in olden times; of a joyful and lively character, and in $\frac{n}{8}$ or $\frac{12}{2}$ time, sometinus in $\frac{3}{8}$; used formerly as a dance-ture, and often introduced is a muvemont of a larger composition. It consists of two parts of eight bars each, and the sbortest notes are fuavers.

GIJO'N, a fortified town and seaport of Spain, in the province of Oriedo (the former Astmias), and 20 miles north-north-east of the town of that name, stands on a low peninsula projecting northward into the Bay of Piscay. It is the best and most regularly bnilt town in the province; is gartly surrounded by old walls, and is lefended by an dd castle and hy const batteries. It has a good port, at which steamers call feondarly. There are mannfactures of stone-wares, hats, and linen fabries; mats and other fruits are exported. . Bermudez, the listorian of smaish art, was horm here, In 718 , the Moors having been defeatel at the hattle of Canicas, were compelled to abandon G., of which they had male themsclies masters. Pop. 6100.

GlL. San (sometimes callex Si Giles), 2 small town of the republic of New Gramula, in the department of goyaca, stands in lat. $6^{\circ} 25^{\prime} \mathrm{N} .$, and in long. $73^{3} 40^{\prime} \mathrm{W}, 64$ miles south-west of Pamplona. It was pommled in 1600 , has a college and manufactures of tubaceo and entton fabries, and a good trada in agrientural produce. Pop. 6000.

GiL, Vicente, the father of the Portugueso drama, was born abont 1470, or, according to others, about 1485, whether at Gumaraes, Barcellos, or Lisbon, is disputed. In accordance with the desire of his parents, he stutien jurisprudeneo at the miversity of Lishon; but his poctical tastes seon drew him away from that science, and his inclination was possibly confirma by the favourable reception of his first poetical essiyy at the court of Emanmel the Cireat. This was a pastoral in Spanish, which was represented befure the court in 1502, to extehrate the birth of the minco who became John 1ll. The queen, lseatrice, Emanuel's mother, was so pleased with the piece, that she wished it to lee repeated at the following Christmas; but G. jroduced a new work for the occasion, also in Spanish, and in dramatic form; so that the introduction of the drama into Portugat coincides with the year of the lirth of Johm M1. G. continned at all the more impurtant festivals to produce similar dramatic puces, in the ferformance of which mot only he and his dauchter laula, who was a distinguished actress and poet, but King. John also took part. His fame spread beyond his own country, and Erasmus, dectarine him to be the greatest dramatist of his time, is said to have learned Portuguese for the lurpose of redding his works. At bome, however, he had detractors, whom he sought to silence once at a party by composing impromptu, on a given proverb, the farce, Inez Pereirk, which is his best picce. Complaints in his works seem to indicate that the court was not liberal cnough to kepp him fiom want in his later years. He cited probably som after 1536. His works were edited by lais son in lägt, and again in 1585 , after undergoins castigation by the Inquisition. It was not till our own times that a reprint of G.'s works, as complete and correct as possible, was undertaken by liarreto Feio, and Monteiro ( 3 vols., Hamb. 380?). Not only loes ( $\mathrm{r}^{2}$ possess historical importance as having late the foundation of a national theatre in Fortugal, but his works deserve study from their intrinsic poetieal and dramatic worth. He has heen callea the Plautus of Portugal.

GIL POLO, Gaspade, a Spanish poet, was born at Valencia in the first half of the l6th century. While town-elerk of his native place, his talents for uffice heeame knowa to Plilip. 11., who appointed him, in lose, coadjutom to the president af the upper financial chamber of the kinghom of Valeneia, and in 1580 sent him to superintend the royal patrimony at Bareduna, where he died. l'efore, however, his time was absubed ly lusiness, G. had occulied himself with pentry. Besiles various lyries, and his Comto de Turize in prase of his native eity, he wrote a contimution of Montomayor's Díun, under the title Primera Porte de Diena enamoradi Cimo Libros, que prosime los Sifter de Joryp Montemetor: This work apheared first at Valencia in betit, the same year in which another continuation of Montemayor's pastoral was given to the world by a plysician mamed Perez Though inferior to the origital romance in invention, Co's continuation so greatly surpasses it, as well as the other contimation, in clearness of thonght and expression throughot tho matrimal portions, that Cervantes exempts it from the condemation of Don Quixute's wher books as deserving as much respect as though Apollo himself had writcen it.' The lost edition of the Diana ememorocte is that of Cerda, which is aecompanied by a commentary on the Cento de Turia Madrist, 1\%is; new ed. ISU2). Biographers have generally confonnied $G$. with a son of his own name, who wat a distinguished writer on jurisprudence.

GilLA, Iin, a river of Forth America, las its origin in the state of New Mexico, in lat. about $32^{\circ} 45^{\prime} \mathrm{N}$, long about $108^{\circ}: 30^{\prime} \mathrm{W}$.; and, after a westwarl course of nearly 450 miles, joins tho Colorado, almat 70 miles above the fall of that river into the Gulif of (alifornia. for more than onehalf of its course it passes through mountains, aml in some places is whully maceessible, beins imprisoned withim walls of frpendicular rock nearly 1000 feet high. The ( $a$, is navimathe for dat loats fur about 180 miles. Numberless ruins of stone-built lumses, auma which fragments of pottery are fonme, vecur all alons the banks of this biver, proving that at some past perion the district must have bean much more poblome than it now is. Sne of these mins, a stmeture of three stories in height, is still in a goonl state of preservation.

GILBERT, WidLesy, a distinguisher natural philosopher and physician, was born in lindo at Colchester, of which town his father was recorder. Ho was a member, and subsequently fellow of St John's Cullege. Cambridge ; was I.A. in 10tio, M.A. in 1564, and 11.D. in 1569. Alout the year 1573, ho settled in Lumdon, joined the C'allege of Fhysicians, and practised with so much reputation, that ho was appointel physician to Queen Elizabeth. Tho time that he conld spare from the duties of his professinu was cmployed in Ihilosophical experiments, particulanly in relation to the mannet; and in theso he was assisted lya pension from the queen. After holding various ollices in the College of lhysicians, he was fimally electelits president in I600. At tho deatl of the queen, he was continned in his offiee of court fhysician ly James I., but he survived lis royal mistress only a few months, and died a bachelor in November 1603. Mis death seems to have taken place in London; but he was luried at Colchester, in the church of the Holy Trinity, where there is a handsome monument to his memory. He left his library, globes, instruments, and cabinet of minerals to the College of Physicians. From his birthplace, he is generally designated as Gilhert of Colchester. His works are (l) De Magnefp, Magneticisque Corporibus, it de Magno Magnte. Tellure. Phissiolugica Noer, fol., Lond. 1600 (reprinted at Stettin in $163 \%$ ), of which there are several edi. tions; (2) De Mumbe nostro Seblunari Philosophia Tova, tto, Ansterlim, I 6.51 (published from a Hs. in the library of Sir William lioswell). The first of these works has served as the hasis of most subsequent investigations on terrestrial magnetism; and (to nse the worls of Professur Whawell in his Mintory of the Induction Scieners) it 'costains all the fundamental facts of the science, so fully examined, imucel, that even at this day we lave little to ald th them.' He estallishes the magnetic nature of the carth, which be regards (as the title of his work indicates) as ono great magnet; and he conjectured that terrestrial mag. netism and clectricity wro two allied emanations of a single foree; a view which was only demonstrated with seientifie strictness mure than two centuries afterwarls hy Oerstel and Faraday. G, was tho first to use the terms 'clectrie force" and 'electric attraction,' and to luint out that amber is not tho ouly sulstance which when rubbed attracts light objects, hat that the same faculty belongs to tho resins, sealinr-wax, sulphur, Hass, \&e.; and ho describes how to measure the excited electrieity by mums of an iron needle moving freely on a point. Galiken pronouncel him 'groat to a degree that might heavid;' and the pablication of his treatiso De Maynete will always be regarded as constitutiog an epoch in the history of magnetism and the allied scicnces.
(iI LIFART ISLACNE colst if the arehijelam of 'lierra del Fnego, offer a gown hartume in Ihnis core-Another inster of the same name, comprising 15 coral islands, forms wart of the shagras Archipelam in the I'acific,

 The two larest are known as Drummond's Isle and
 than in mile hown, the latere of miles liag. The inlabitants resemble the Malays in allearance, and are divided into three classes-chiefs, landholders,
 promets are the enour-mut and the pandimus.
(blLiblintives, a religions onder in the Poman Catholie ('luarch, spectially moteworthy as mine of Enclish origin. It was fommed in the twelth c. by st filhert, a mative of sompringhm, in Linemenshime. The rule of the onter was manly derived from that of the ('anms Iipgular of st Augustinc. St dialloert also fommerl an order of mons after the Benelictine institnte. [hoth orders were apmosed, and land nomerons coments in England at the time of the Refiomation, when they shared in the gemeral supuression.
(illdo'A. a Hebrew worl signifying 'bubbling fomntain, is the name wiven in the ©hit 'Testament tion range of hills, between sol and bot feet high, orerhaning the city of Jezreel, in the castem shle of the plain of Estraelme. It is memoralile as the scene of the defeat and death of king Sinl and his three sons.

## GILD, See Gutid.

 Wise, ly others Bahmicus, appars to have leen horn in the year 516 . IIe visiterl France in frat, amd Ircland in 565. He died in 50. His De Ereitio biritemine Lidor Qurulus was tirst pinted at London in 150.5 , and has been often reminted lonth in Englame aud on the continent. The best editions are Mr S'tevenson's, puldished ly the English Historical Society (Lomi. IS38), amil Mr Petrie's in the Jommenta Mistorion Pritmaice (lond. IS18). 4 is a woth and worly writer. Giblum has justly lescribert him in a single sentonee: ' 1 monle, who, in the pofond imomane of limman life, has fresumel to exereise the oftiee of listorian, stramely hasigures the state of Initain at the tione of its sefration from the forman empire" Ilis wsurne aml meare narrative may be divided into two indions-thes first extending from the berst insamion of britain ly the Jomans to the revolt of Maximan, at the closin of the the c . the sccomi, from the revolt of Anximus to the author's won time. The secomd portion is even more manatisfactory than the lirst.
 ravging with the mature of the sulbatince the :uhed, and the kind of eftact required to be proTheme, hat they may all bre classified under three heuls-mamely, lst, meehanieal githling; $\boldsymbol{2}$, chenical giloling : 3, cncanstic gillins.

The tirst is used chedy fir gildine wom, phaster of Faris, and other comipesitions, in imitation of wond-carving. It conssts simply in laying leafwolle mon the surface of the article, which is first prepreat with a layer of thin white, emmpeel of hort size and whithig; thon, if the gilling is to Ine larnishul, another liyer of thich white uf smilar compusitiom, but with mure whiting, is aulded; after this, a roating of whl-size (see (ioln-sbe) is hroshel ower; this is wetted, and the gold-leaf is laid upon it. A consiberahle amount of skill is respived in pidkins up, cuttins int, the proper size, and laying on the pieces of gold-leaf, sy that
there shall be as little waste as possible, and all the inequalitios of a raisel design equally corered. The pold-leaves are first slwad upon a eushion by hlowing them from between the leaves of a lowok, then ent into the reguired sizes, and lifted and daid on the work ly means of a tip, which is a sint of comly formed of lristles. When the gold is thus lain om, it is forcibly hlown to axpel as much as possible of the nuristure under it, and then further pressel and smmethed hy means of a camel-hair hosh. Whan it hats reached a certain state of hrypess, it is mamished ly mbling with a lmumber of flint or agate. The nise of the underlayer of whiting and size is to wive a somewhat yichling surfice," which rembers it pussible to rub the mideleaf loriskly with the momisher withont, abrading it. Portions of the smfaee wheh are left mbumished in dead-grold are called the matt. The ahove proerss is called bminish giteling. Oil cilding diffors somewhat from this in the preparation of the surfaee to revire the gold leaf. Two or three coatines of thin white, mixel with a little mellow clay, are aplied: then two or three coats of 1dain gelatine-size, called clour cule: and finally, the ril guh-size (see (iold-Size), mon which the grld is laid whm it is nearly dry on tacey. Those parts which require burnishing are treated as before describerl. Jopun gildiag will be described noder diphnitige.
Chemiont filding--DICtads are now usually gilded by the process of electrogilaing (sce Galyanish), hint hesites this, various methods of chemical gilding have been ahopted, and some are still in use.

W"ater silling, as it is very inappropriately termed, is condacted by aphying to the surface to be gided a thin cont of in amalsam of gold, ance then by luat hriving of the volatile mereury, when the Lolal remains athering firmly to the surface, but having a dull amel dingy brownish-yellow culour. The chour and lustre of gold is hrought up by wroctelin!! with a wire-brnsh, or burnishing with a Hombstonc, or black hematite burnisher. The amalyan of ishl is mate ly dissolving leaf-ghld or precipitated gold in about ten times its weight of merenry, and then washing and straining it through wash-leather. The surface to lie gilt is nsnally prepared by dipping it in a solution of nitrate of mereury, "I mick-motor, after it has been well Ileamed; this coats it with a film of mercury, and insures adhesion of the amalgan. Water gilding is very injurions tu the men and women who work at it, on account of the mercurial funes. Modern impromements in the constraction of the furnace, where the 'drying ofl' is condncted, have dimimished this cril emsiderably, and at the same time ceonomised the proeess by recondensing and saving the evaporated mercury; lant still, with the hest arrangements, the health of the water githers is affected. This process is only applicable to metals that readily form an amalyam with mercary. Iron and steel, therefore, camot be directly gilded ly it. It is still in use for lartons and some kinds of common jowellery. Thirty thousand buttons, one inch in diameter, may be gilded with ne nonce of wold ; 14 or 15 thonsand is the number over which this 'pamtity is commonly spread.
dilling by immersion.-For this purpose a solution is used which slowly attacks the metal to be gildel, and at the same time deposits on its surface in curuvalent of erld. Elkingtom's patent solution is mate by dissolving $\frac{f}{f}$ bunce troy of fine gold in $\because 1$ manes of nitromuriatic acid, leating this until red and yellow vapours cease to be evolved, then dilnting with $1 \frac{1}{2}$ lint of distilled water, adding to this 1 fomal of licarbonate of potass, and boiling for two bours. The article to be gilded is dipped
into this at nearly the boiling heat, and awitated in it for about a minute. 'Talher's pratent sulution is male ly adoling a sulation of grell to a sulation of malle arid in water, alcohon, or ether. The atheles are diplued as atmer.

The mothon called forminer fikfiny is a promes intermodiate botwern the abovernd water whline. Sal ammonite and corrosibe sublimate are disuolved in nitric acid, amd gell is dissolved in this solution, which thas beomes a maxture of ehlarime of suld and nitrate of mareury with sume atmmonit. 'Thes solutions on beime aphliod to a smabee of silvor. mmmediatery hatkens it. lut uph the aplication of hoat, it is rebly sibled.

Most artiches that are milued ly ather of the
 -nhmitted ta an atter-puosess of polourine. This comsists either in astimer opme the surfere with a sonhas solution, and leatime the artiole ofter warels, or in contines it with a kind of varnish wi hagewax and gollow-achac, amd than lomra ins it off. Varionis silline solntions are usiul,

 nitre dissolved in half a pint of water is recoms. monheil. Also $2 t$ parts of nitre, 10 alma, 5 sulphate of iron, 5 sulphate of sine lociled towether in suthicient water to form a paste when conled with contimual aritation. 'l'he artieles are immersed in this, and then herated till the desired entour is ohtained.
(iohl Wilding.- Vor this a wilding powher is timst prepared by dissnhing S drams of pure gold and]
 then moistemine clem linen raer with the solution, and furniog then to ishos. "These ashes contain finely dividen of copler, lrase, or shrer, ly simply rubhing it ower them with a phece of cork nobistencl with a solution of common salt in water

Sworlhhades, lancets, and otine stecl articles are gilded in fancy dovies by drawing the desinn with a camels-hair pencil nowistmed in a sulution of grold, prepared by aritatiou ether with a solntion of tercliloride of gobl, and lecanting the hight lipaml which thatis on the tolp. Naplathay he used in the same manuel for this purpuse, ath is mach cheaper.

Silks, satins, ivory, bone, \&ro, may masily ha gilmod ly inmeran's them in a newtral solution of l part of terchlomie of endel to 4 or $\overline{-}$ of water, ami then exiosing them to the aetion of lydrogenger, which rearlily combines with the rhlorine and reduces the gode to the metallie state. Flowers. and other ornamental desicns, may be thms produced in gold hy smply pantury them on the surface with a camel's. han lirush dipend in the erold solntion. The artieles may then be suspunded in an inverted tumbler or other suitable vessel, which, if pacend wer a bottle containiner dibute sulpharic and and irom tiliogs or rive scrapes, will eolloct suldicint of the light gas to brine ont in a few minutes a beantital and bermantint pure rold surfiter.

Enmenstic yilhling is usually applion to glase and porectan. The gold is tirst obtaned in a tinely civided state hy precipitating from the chlornle with protosulphate of iron, or ly simply heatine the chbruhe. This pewder is gromen up with giv at its wricht of swile of bismuth and some lurax ath? coml water, and them praintel on the ware. It is then heated till the brax is vitrition and the gold therely fixed. Sometimes the cond is gromme with tmpentine, or an amaly gom of gold is used. It lias a brown dingy appeciranter when it laves the kiln; the fold lastre is luroght up, by bumishime.
 gomb are made, is required to hase as nemily as
posille the colour of yohl, so that when the surfaceuilding is wom off at the mone expered parts, the delferchece of conar will not be readly agrarent. This is obtainal ly makine a kind of brass howine a math herger prametion of colper than in common ins:-
The followine are the weopipts from amoner a vanty iu nas : 1 st, 6 ]arts copper, 1 common leass;

 nath harder than Xo. 1 or
(AI'I, Vi.!l) (in ling. 'reaion of rorks') was a monntinoors district on the vast sile uf the Jurdan, lammed on the $N$. by the risw Heromax (lhe mulern sherint-nh=1/umilhar), whoh separated it from the rich lupois of lianhen; on the lis. hy the desert tahlolamds of Arabia: on the s. By Hoab and Anmon; and on thes W. by the Jorian. In spite of its nome the veretation is laxumant, esper (iblly in tha mislilla, ami romm? the lrook Jablink, whe fer forests uf ouk and torebinth enecur. The hills are nut very high; they have hroal summita almost like tahle-lamp, 'tossed,' says I'mofessor stamloy (simari and l'elestine), 'into wilal confusion of unclu. latiues downs." (i. ancuently probluced yums ant spices. It was given ly dushma the tribes of fiad and liculam, bueanse of the multitude of their cattle, ind its a froutior hamb was much exposed to iuvasion.

GHLF'fLLAN, GmonaE, ritie aml assayist, was lorn at lommie in lisl: He stmolime at the mirevsity of Glaseow, and at the divinity hall of the Srecession buly, afterwards the ["nital Presbytarian C'hurelp, and in 1535 he was licensel to preach the ersipul. In Jarch ls36 he was ordaned to the
 mundrous. They display a rich lant reckless fancy, and wide literary sympathies, althourh deticient Irerlapes in retimement of taste. 'The principal are,
 Gutlery (Isi9) ; The Barmls of the Bille (1850); The

 Mistory of a . Man (15itb) ; Christianit! and OMr Eice (18.5)) ; and 1 lpher and ometre (1sion). In 15.3is he commenced an edition of the British Poeds pablishen by Nichod of Elinhmrgh, whimh extemded to 4h vols. His contribntions to prionicals bave been mumerons.
(xILL (Low-Jat., :fith, a Rrinlineglass), a measure of capacity, fontaining the fourth part

 of the temperate parta of Sorth Ameriea. The ronts are used in medicine as a milal emetic, ant in small doses as a tonic; and are often ealled

 are sonctimes planted in shmblurise, on acoomet of their !racefnl foliage. 'They grow to the height of almut two foet.

GildLIS, su, an uld town of franee, in the department of (and, is situated near the borders of the departmont of lionolhes du lahome, on the Ginal de leancaire, la miles sonth-sonth-east of Nimes. Its abluy churn, the west front of which is a master-pince of liomanespue architecture, and is corered with the riehest decmation, dates from the Ilth $c$., and is the most motable building in the town. The neighbomhood wit ir. produces a stonn red wiun which is exported. Hop. 5730.

GILIAES, Jomis, LI.!., known as a classien historian, the son of Robert Gillies, Esy, Wat horn T0. 3
at Prechin. Forfarshire, lanuary 18,1747 . N1is
combonst honther, Adam, was a judge of the court of session in seotlame, mader the title of Lord (rillies. (8. was ducated at the maversity of Clasegw ; and, :utar a time, tonk up his resitence in London, with the view of following literature as a profession. He sulsequently acted for several gears as traselling tutor to the sons of John, secome Larl of 110 for life. In 172. he publisher a translation of the Vrations of lisocratis and those ut Lusins, with some Acconent of tho ir Lipes, 4to: and in 1756 appared the tirst part of his Mistory of Anciont Greece. This work forms 2 whls. 4 to, and 4 vols. Svo. It was +xtremely popular on its tist appearance, and is really far from being a discreatitable perfomance, thongh murh distigirel ly verbosity, and dull and prolix dispuisition: lat it las droperd ont of notice nearly altorgether since the alranee of lireek scholirship in the present century, and the publication of the histories of Thirlwall and (irote. His Jiew of the Reitn of Freterick II. of Prussia appearel in 1789, syo. In 1793, on the death of Dr labertson, he was aljminted historiographer to the king for Scotlam, with a yearly salary of よ゚?O. His other works are, a translation from the (ireek of Aristotle's Ethics and Politios: comprisin! his Practical Philosophy, with Nutes, the rritical History of his Life, and re new Analysis of his speculutive 1 orks, 2 vols.; Supplement to the Alunlysis of Aristotle's Specalative Works (180.4): History of the IF ortel, from Alexcmuler to Auphestas, $\because-3$ vols., too (1807-1810); Trenstation of Aristotle's Riluturic (1833). He died Fehruary 5, 1836.

Gllas. See Rrapimation, Orghes and ProCES OF.

Gi'LlyFlolver, a popular English name for some of the cruciferons plants most prized for the beanty aml frogrance of their Howers, as wallflower, stock, \&o. The clove-pink also. the will original of the carnation, is callet Clure-rillythwer. The name $G$. has been regarded as a corruption of July-fluater l lut in Chancer it alpears in the form gilufre; and the French girofle inticates the true ilerivation from firoll, a clove, the smell of the Clowe ti. being snmewhat like that of cloves.

GILOLO, or ALMAIIERA, one of the Molucens or spice lsthons, and the thief of a gromp, of the some name, is crosen by the equaton in lomy $10 b^{\circ} \mathrm{E}$. In its general ontline it hears a vague resemblance to its western neishbour 'elebes, from which it is seprarated by the Molucea Passage, hoth of them being as malike in form to any other ishan as they are like tur ewh other. It is diviked towards the tant from New Guinca by a wide chanmel of its "wn nane. It contains almot 6510 symare miles, comprising several jutty states, which are connectel chuefly with the buth settlements in the Eatst Indies. The imperts are manufactured groods, ofium, chim-ware, and iron; and the exports are sago, cocoa-muts, spices, fruits, pearls, ghll-dust, lurses, sleech, and hornm eattle. The interior is mountainous, and in many parts densely wooded.

GTLRAY, JAMEs, a celebrated caricaturist, born in Londem about the middle of last century. He first became known as a successful encraver abont 174. and between 1759 and 1511 issucd as many as 1200 caricatures, nmbers of which, it is sais, 'were "telned at meer uron the celper withont the assistance of drawings." They are full of hroal homour and keen satire, the sulijects of his ridicule heing wherally the Freneh, Nampon, and the ministers, Thmugh he often diverged to assail the social follies of his buy. He died ist June 1515. Ge's drawings have nften been pubhisherl, but the bost edition is
that of M‘Lean (acemmanied ly an illustrative deseription), in 304 sheets (Lond. 1830). More recently, an edition las been issued ly louh.

GHLTHEAD (Mrysophry, a genus of acanthop,terous fishes of the family speriles, baving in deep compressed ludy, a single florsal fin, tho anterior rays of which are spipous, the checks and sill-covers covered with scales, the teeth of two kinels, six conical weth in front of cach jaw, and four rows of oral rounded grinding-teeth in the upper jaw, three rows in the lower. They feed chietly on mulluses, the shells of which their teeth emalle them to crush to pheces. The sprecies are munerous; inhabitants of the warmer seas. One

> Common (ritheal (Chrysopherg aurata).
species, the Cumbos G. (C. aurata), is foumb, but rarely, on the British coasts; it abounds in the Menliterranean, and is very much estecmed for the talile. It seldom attains a length of more than twelve inches. It is generally fomm near the shore, in small shoals, ani its presence is sometimes hetrayed to tishermen by the moise which its teeth make in crnshing shells. It is sail to agitate the sind with its tail, in orider to get at the molluses enncealed in it. The lack is silvery gray, shated with blue; the belly like polished steel; the siles have golten hands; and there is a half-moon-shayed golden spot hetween the eyes, from which it derives the name $G$., the Latin name Aurota (gilded), and the (ireek name Chrysozhys (golden eyebrow). From the Latin furcta comes the French name Iorme. This tish was very generally kept in the rimaria of the ancient Romans, being much valned and easily fattench. Another speeses ( 6 . microdon) is also found in the Mediterranean. - The name $G$. is also given to a british fish of a different family (Ledrider), a species of Wrasse (i. v.).
GAld TOVS. This term is known in trade as a lesignation for smadl articles which are gilded, that is chetly applied to the cheap jewellery which is almost exclusively manufactured at Lirmingham. In that town this trade is very extensive, and emploss thonsads of persons and a considerable anmmit of machine fower. Cheap jewellery of the most elegant forms is made from copper, which is drawn throurh rollers for the purpoist, into small ribhons and wires, with elegantly embossed surfaces to represent the tine chasing cmployed on articles made from the precions metals. These the gilt-toy maker twists and solders into brooches, bracelets, rimgs, and a varicty of trinkets, usually with a raised brarll for receiving a piece of whished colonred Hhass, or a cheap stome. Previnus to setting the Hass or stone, the trinkets are strung on collyer wires, and sent to the electro-plater, who gives them a coating of gold or silver, aud returns them tis the gilt-toy maker, who finishes them by burvishing and by setting the imitation gems. In this way really beautiful imitation jewellery is proluced at an incredibly small cost; and being coated with the precims metals in the pure state in which they are In losited by the electro-plating process, their
spurious character is not easily detected by the uninitiated.

GI'MP. LLS (Lat. gemellus, a twio), are two circular brass boup used for suspending the com-pass-box on board ship, so that it maty always rest horizontally, noaffected by the ship's motion. 'The onter hoop is attached to a lux or other fixed object, while the inner is constructed su as to allow of its moving freely within the rater, to whieh it is attached ly two pivots at the extremities of a diameter. The compass-loox is attached to the inner buop by two similar pivots at right angles to the former. Thus, the compass moses freely in two directions at right angles to each other, and ean always retain its horizental position, however the vesset may roll or pitch. G. are often applied to uther instruments, such as the momutam barameter, de.

GI'MBLET, a tool for boring holes in wood to receive nails, screws. \&c., and gromerally used when the hole is to he larger than can be bored with a brad-awl. It has a conical screw point, followerl by a groose for clearing, and is fitted in a cross or ' T ' landle. An improvement has lately been made by twisting the grooved part of the gimblet, so that it forms a long spiral groove.

## GINENA, or XIMENA. SeeJImena.

GIMP, or GYMP, a kind of trimming for dress, curtains, furniture, \&e., mate either of silk. wool, or cotton. Its peculiarity is that fine sire is $t$ wisted into the thin cord of wbich it is made.

GIN is a machine used for raising weights, lriving piles, ke., and cousists of three poles, each from I2 to 15 fect long, and 5 inches in diameter at the lower end, taperina to $3 \leq$ inches at the upper. The poles are united at the top, either by an iron ring which passes through them, or by it rope which is twisted several times round each, and to this 'joint' a pulley is tixed. Two of the poles are kept at an invariable tistance ly means of an iron rod, in order that they may support the windlass which is attacled to them, its pivots running in iron cbeeks fixed to the poles. When the machiue is to be used, it is set up over the weight to be raised ; two blocks arranged according to the second System of Pulleys (q. v.) are fixed. one to the top of the poles, the other to the weight; and the rope, after passing round both blocks, and over the pulley before-mentioned, is attached to the windlass, by the revolution of which the weight can then be raised.-The name of Gin is also given to a machine used for raising coal, \&c., and also for communieatiner motion to thrashing-mills. It consists of an erect axis or drum, firmly fixed in sockets, to which are attached transberse leams, varying in number according to the power required. To the extremity of each beam a horse is yoked, and they are then driven round in a circle. If coal is to be raised, the borses must either be frequently unyoked, and turned in the opposite way, or the machinc must be made reversible; the latter of which is found to be preferable, as a saving both of time and labour. This machine is now rapidly disappearing bcfore the steam-engine.

GIN is a machine used for disentangling the fibres of Cotton (q. $\because$ ).

GIN, or GENEVA, an alcoholie drink, distilled frem malt or from nnmalted harley or other grain, and afterwards rectified and flaroured. The gin, which forms the common spirituous drink of the lower classes of London and its vicinity, is tavoured very slightly with oil of turpentine and common salt; each rectifier has his own particular recipe
for regulating the quantities to be used; but it is usually about 5 tluid onnees of spirit of turpentine and 3! 1hs of salt mixed in 10 gallons of water ; these are placed in the rectifying still, with 80 gallons of prooi enon-spirit, ami distilled until the feints lemin to come over. It is then used either tasweet-ned or sweetened with sugar.

We druve tha terms gin and geneva from the Dutol, who call the lloliands-gin (whieh is their national spirit) finier, which they have rerived from the french amierof junipur. The erigin of this nanue is, doubtless, to be found in the employnoent of juniper-berries in lavouring the spirit made from unmalter Itiga rye in Hablan?. where it is an article of crat manufacture, chiedy at schiecham;
 well as geneva and sin. So extensive is the manufacture of this spirit in Hullaud, that in Schiedam alome there are 175 distilleries, employing nearly 1000 nuen, besides which there are 30 more distidleries in Gomita, and 17 in Amsterdam, and others scattered alout the country. Notwithstanding this immense mannfacture of aleolol, the Dutch are by no means an intemprate prople: the fact is, the larger part by far of the spirit made in Holland is "xported to other countries, especially to North Anurica and Northem Europe. It was formerly always exported in bottles, but casks are now much ustel as well. The chief manufactories of gin in England are those of Messers Bootly and Messers Smith and Nicholson, in Lomlon: Messrs c'oates and Co., at l'lymonth ; and one or two large distilleries in Bristol.

Perhans nothing used as diet by man is liable to greater and more injurions adulteration than gin. Almost every gin-shop, keever in London has some vile recipe for increasing the pungency and givin: a factitious strength to the much dilutel sweetened spirit sold under this name. A mere enuneration of the articles usually employed will give some inea of the extent to which sophistication is carried on with this spirit: rwach alum, salt of tartar (carbonate of potash), oils of jumper, cassia nutmeg, lemons, sweet fennel, and caraway ; coriander seeds, cardamoms, and capsicums; and morse than all, creasote, which is most injurious. It is saicl that sulphuric acid is even adiled, but this is by no means probable.

GI'NGAL, a weapon used by Asiatic armies in the defence of fortresses. It may he described as a large and rude musket, which is fired from a rest. The Chimese employ it to a considerable extent.

GI'工GEE is one of the Yirgin Islands-the group at the north-east bend of the grand arch of the West Indies.

GINGER (Zingiber), a genus of plants of the matural order scitaminear ir Zingiberacea, baving the inner limb of the yeriantla destitute of lateral inner lobes, and the fertile stamen prolonged beyond the anther into an awl-shaped horn. 'The species are peremaial berbaceous plants, with annual stems, and creeping root-stocks (rhizomes); the stems produce leaves in two oprosite rows; the flowers are in compract spikes with bracts. They are natives of the East Indies. The root-stocks of most of the species are used as a condiment and in medicine. The most valuable and generally used are those of the Comos G. ( $Z$. affinale), sometimes distinguished as the Narrow-leaved G., which has been cultivated in the East Indies from time immemorial, and is now also cultivated in other tronical comotries, particularly the West Indies and Sierra Leone, from both of which, is well as from the East Indies. its root-stocks-the ginger of commerce-are a eonsiderable article of export. The root-stock is about the
thickness uf a man"s tinger, knotty, filumes, and fleshy when fresh. The stems which it sends up are reedlikc, invested with the smooth sheaths of the leaves, senerally three or four fect high. The leaves are linear-lineenlate and smooth. The flowers are mot proluced on the leafystems, hat on short leatless stems iscapes), in spikes ahont the size of a man's thumb. and are of a whitish colom, the hip streaked with ?umh. The cultivation of $f$. is extremely easy

Common (inger (Zingiber officinale): $a$, a flower, tetached; $b$, perfect anther.
wherever the dimate is suitable. In India it is carricd on to an clevation of four or five thousand fect on the Himalayas, in moist situations. The root-stock is taken up when the stems have witherel, ane is prepared for the market cither by seething and scalding in hoiling water-in order to kill it-and subsequent drying, or loy scraping and washing. The tirst methol yields black G., the second Mhite $G$. ; the backest of Plack $G$., however, being only of a stone colow, and the whitest of White $G$. very far from perfectly white, unless bleaching by chloride of lime be afterwards employed, as it not unfrequently is, to improve its appearance, a process not wherwise alvantageous. There is a considerable difference, however, in the original colour of the roat-stock in the $G$. of ilfferent comenies, which is supposel to be owing to difference in the rarieties cultivated. The uses of (i. looth in moficine, as a stimulant and carminative, and in dumestic conomy, as a condiment, are too well known to require particular notice. Its gualities depend very much on a pale yellow volatile oil, lighter than water, called oil of "ingor. It contains also a considerable quantity of starch.-Cendied G., or Preserved 1 ., consists of the young rootstocks preservel in sucar, and is now inported in considerable fuantity from China, as well as from the East Indies anil from the West Indies. It is a delicions sweetmeat, and is useful also as a stomachic.- Fssence of $t$, much nsel for tlavoming. is m reality a tincture, prepared of G. and alcohol.Stmep of ${ }^{\prime} t$. is used chielly by irnggists for thavemr. ing.-Gimger Tea is a domestie remedy very useful in cases of flatulence, and is an infusion of $G$. in hiling water-- fínger-bro ( $\mathrm{q} . \mathrm{v}$.) is a well-known beverage, dlavonred with minger.-Ginger )fine (q.v.) is a cheap liqueur flavoured with ginger--1t. was known to the Romans, and is sail by Pliny to have leen brought from Arabia.-Another species of $G$. is Zfeumbet (Z. arumbet), also called Broad-leaved
G., cultirated in Java, and of which the root-stock is sumetines erroneously called Tiound \%echary. The root-stock is much thicker than that of emmanon G., and is less pangent.-The root-stock of the ('assumusar (Z. cussumunar), sometimes called Yellew Zedoary, has a eamphor-like smell, and a lifter aromatic taste. It açuirer a high reputation as a medicine in England and throwhont Europe about the close of the 17 th e., Jut having been extolled not merely as a stimulant and stomachic, lut as possessing virtues which dim not in reality liclong to it, it soon sumk into ollivion. - The root-stock of the Dloga ( Z. miome) is less pmonent than $G$., and is much used in dapan.-Cattle sent to graze in the jungles of Northern Inlia, during the rainy season, are supplied with the rout-stucks of a species of $G$. ( $Z$. cupitatum), to preserve their health. -The root of Aristolochin (y. v.) Cunadense is sometimes called Indiun $G$. or Wild ( 6 . in North America, and is used as a substitute for ginger. It has a grateful aromatic odonr and taste, and is stimulant, tonic, and diaphoretic.

GINGER-BEER. In effirrescing drink made by fermenting ginger, sugar, and some other ingredients, and hottling hefore the fermentation is completed. The following recipes are amongst the fest known : Lump sugar, of lbs.; crushed Jamaica ginger (the unbleached is hest), 5 oz ; cream of tartar, $4 \mathrm{oz}: 10$ lemons, sliced ; and 5 gallons of boiling water. They shonda be mixed in a vessel which can be kep,t covered matil cool, but require stirring from time to time as the cooling goes on. When lukewarm, add 10 oz . of yeast, and kecp it in a warm phace to encomage the fermentation, which soon commences; after one day's fermentation, strain through a flamel filter, and let it stand to ferment again for a short time; then take off the scum, and bottle. The bottle must be tied or wired down. Another recipe is: Cream of tartar, Buz. ; ginger, 1 uz. : refinel sugar, $1 \frac{1}{2} \mathrm{hss}$; 1 sliced lemon ; $1 f$ gallons boiling water; 1 oz y yeast; to be treaten in the same way. A spurions ginger-bect, largely used, is made liy putting a few drops of incture of ginger and a little syrup in a bottle, aul fillins it ng with aërated water from the sodawater machinc.

GI'NGERPIREAD. A very well-known article of foorl. which has heen in rogue certainly since the lth c., when it was made and sold in Paris, according to Monteil in his Mistoire des Francais (tom. ii. $711.47,48$ ) ; it was then mande of rye clough, loneaded with ginger and other spice, and luney or sugar. It was probahly introduced to England by the court of Henry IV., and since that time has playerl an important part in the pleasures of young and old at the fairs and festivals of the country. Changes were no loubt wronght in its composition as soon as it appearal in this comntry, and the expensive honey gave way to the cheaper treacle which was then in use, and the colour was hidden under some colouring matter or gilding. 'To take the gilt of' the wingerbread,' has become a proverl, anil the bonths glittering with their gilded array of rude devices in gingerlirent, so familiar to our boyhood, still make an occasional appearance in the country fairs.
Three forms of this article are to be found in most pastry-cooks' shops, and one or more of them in the sanctum of every gool housewife. I. Square soft rakes, from two to three inches in tbickness. 2 Thin cakes of various forms, but most frequently romet, being stamped out with the top of a wineglase, or other contrivance. 3. Small button-like cakes, called gingerbreat-nuts. The two last should be baked very quickly, crispness being indispensable.

## GINGER-WTNE—GINSENG.

The constituents of modern gingerbrearl are treacle, after being slightly roasted. The male and female moist sugar, wheaten-flour, and butter; a little, ilowers are on different trees, lut the Chinese plant carbonate of magnesia and tartaric acid, or carbonate of ammomia, are also $1^{\text {nit }}$ in to give lightness ly many makers.

GINGER-WINE, a popular and cheap liqucur, made ly the fermentation of sugar and water, and thavoured with various substances, hat chiefly with ginger. It is partly an article of domestic manthfacture, and is party made on a larger scale for sale. It may he made loy dissolvint: abont six pounds of sugar in fourteen gallons of water : alling four ounces of bruised ginger and the whites of two eggs, well beaten; mixing thoroughly : boiling for a quarter of an honr ; skinmin; carefully; and when the lifun has cooled, adhing the juice of four lemons, and also their rinds for thayouring, with a tea-cupful of ale-yeast to promote fermentation ; letting it ferment in an open ressel for twentr-four hours, and then putting it into a cask of suitable size, closely morewh, in which it remains for a fortnight hefore it is bottled. It is, howerer, very common to increase the strength of ginger-wine by the addition of slirits, the Hlavour bein also modifiea by the kind of spirits employed. A little spirits added makes ginger-wine keep well, and it tren impores in quality for many months. It, quality derends much on that of the sugar and of the ginger empluyel, ant also on the care with which the manufacture is conducted.

GI'NGHAM. A cotton fabrie arimally introduced with its present name from [ndiar ; it is now mamfactured to an immense extent in britain, and our manufacturers supply, to a very great extent, the Indian markets. It difiers from calico in the circumstance, that its colours are woven in and not afterwards printed. At first, the Indian ginghams consisted of cotton eloths, with two or more colours arranged as a small checkered pattern; now, a great variety of designs are found in this material, and in the case of umbrella ginghams, the whole piece is woven with yam of one colour. The following are the chief kinds of gingham known in the markets of Great Britain: plaim enmmun light grounds; plain common dark grumuls; Earlston finghams: power-loom seersnckers aml checks (imitations of the Indian ${ }^{\text {natterns) }}$; muslin cromod (stripes and ehecks); furniture stripes and checks: coloured diapers; erossover stripes; derries, Hongarians; jean stripes, and umbrella ginghams.
GI'NGILIE OIL, a name often given to the hand fixed oil eldainel by expression from the suads of tesamum Indicum. See Siessmem.

GINGKO, or (INKO) (Salisurtice ulichtifulia), : larce tree of the matural order Tuxace (row, \&c.). with straight erect truuk and conical head, and laves romarkally resembint the leatlets of the fronds of madenhair, somewhat triangular, clowen and notched at the upper "xtremity, shatly stalked, leathery, smooth, shiming, yellowish green, with numerous minute parallel nhs, and somewhat thickencl margins. The fruit is a sont of thruse of which the fleshy part is formed loy the persistent calyx, abont an inch in limeter; the nut or endocarp white, a thin shull with a farmacous kernel resembling an almond in diavone, with a little mixture of ansterity. The tree is a nitive of Chima, lut has been long known in Europe, and large trees are now to be seen in Eucland. The wool is easy to work, receives a fine polish, is yellowish white, reined, and not resinous. In China and Japan, the G. is grown chiefly for the kernel, which is freed from austerity by loiling and roasting. The fleshy purt of the fruit, although resinous and astringent, is also caten

Gingko Tree:
$a$, brunchet of female trec; $h$, branchlet of male tice, in flower; $c$, mate fowers; d, female flowers; e, fruit ; $f$, anther.
several close towether, which grow into a monstrous tree, producing twath male and female dowers.

GINAEN(, a ront highly cotecmed in China as a meticine, heing miversally regarded as possessing the most extraorlinary virtues, and as a romedy for almost all diseases, but prarticularly for exhaustion of body or minl. It is sometimes sold for its weight in gold. It was ince introduced into Europe, lut soon forgotten. It is the root of a species of Pomax, of the natural order Arulacer, to which the name $I$. Gimseny has been given, amd which is a native of Chinese Tartary; liaving a stem from me fort to two fect high; leares on Jong stalks, five-fingerel, and almost duite smooth; and umbels on a Ions terminal stalk. It is doubted ly many botanists if

Ginseng ( $P_{\text {encter }}$ quinquefulium).
this species is rally distinct from $P^{\prime}$. quinquefolium, a common North Ameriean plant; the root of which is now an article of expert from North America to China, and is used as a domestic medicine in the states west of the Allegranies, but which European and American medical practitioners gencrally regard ars almost worthless. It is mucilaginous, sweetish, and slightly bitter and aromatic.--P. fruticosus and
$P$ cochleatus are fragrant aromatics, growing in the Moluceas, and used by the native practitioners of India.-The fruit of the genus Panax is succulent, compressed, with two or three leathery one-seeded cells.
GIOBE'RTL, VIXCENzo, a remarkable Italian writer and thinker of modern times, was born in 1801 at Turin. He was educated for the church, olvained his degree of doctor of theology in 1823, and was orlained to the priesthood in 1895 . He was subsequently appointel professor of theology in the university of his native city, and on the accession of Charles Albert, was selected as chaplain to the court, an office which he tilled with distinction till 1833. At this period of rising political agitation, (G. was acensed of promoting the liberal movement, was dismissed from conrt, and suffered an imprisonment of fom months. Haring obtained permission to retire into banishment, he went first to Paris, and shortly after to Brussels, where he spent eleven years as private tutor in an academy, pursuing in his leisure hours his private studies. A derout Catholic. G. looked upon the papacy as the divinely appointed agency for the elevation of Italy among the nations. A confederation of states subject to papal arbitration, and having in the king of licdmont a military protector, was the scheme devised by $G$. for the unity and regeneration of his country. In short, in the 19th c. be advocated the Guelph policy of the middle ages. These views be elaborately devcloped in his work entitled, Il Primato Civile e Morale degli Italiani (The Civil and Moral Supremacy of the Italians). Its pullication in Paris in 1812, during the author's cxile, was hailed with the utmost enthusiasm by Italy, with the exception of a limited and far-sighted section of the conntry. The liberal and conciliative policy adopted by Rome on the accession of Pius IX., appeared the verification of G.'s predictions, and increased the popularity of his name. On his return to Italy, he was received with universal orations from all classes of the people, and was honoured by being chosen hy several towns as their representative in parliament. The king aprointed him senator, he subsequently was elceted president of the chamber of deputies, and finally prime minister ; owing to the great divergence of opinion which divided his ministry, he held othce only for a few weeks, and was forcel to resign. His successor despatched him to Paris on some unimportant mission, in order it was thonght to remore him from Turin; and thus endel G.'s political career, as from that period he filled no official position, lnt devoted bimself exclusively to literary pursuits. As a politician, G. failed in far-sightedness; and with the course of events in Italy, his intuence as a political guide incritably deelinel : but the depth and range of thought and strength of conviction evinced in his various works, entitle him to the consideration and standing which as a writer be enjoys. G.'s remarkable gentleness in private intercourse bore no trace of the energetie furce with which his writings propound an opinion or deuounce an opponent. He died at Paris of apoplexy in 1853. His chicf writings are entitled, Introduzione allo studio dellet Filosofiu (Paris, 1539); Il Primato (Paris, 18t2) ; Il Gesuith moterno, 8 vols. (Lausanne, 1847); Il Rinnovamento civile degli Italiani (1’aris, ISñ1).

GIO'JA, the name of four towns of the south of Italy. The most important is in the province of Terra di Bari, 26 miles sonth of the town of Bari. It is a thriving industrious place, surrounded by a fine fertile territory. Pop. 1-4,000. It was formerly famous for the beauty of its woods, the favourite bunting grounds of the Emperor Frederic II.

The second town is in the province of Calahria, Ultra I., sitnated a mile from the sea, and 28 miles north-cast of lieggio. It is said to be of ancient origin, and has sustained several severe sieges. It was finally all but destroyed in 1783 by an carthquake, and now possesses only about 1000 inha-bitants.-The third G. is in the province of the Abruzzi, Ultra 1I., 34 miles south-south-east of Aquila, and 60 from the sea, with 2409 inhabitants. Its territory, althongh mountainous, is productive. -The fourth is a town of 3560 inhahitants, in the province of Terra di Laroro, 6 miles north-west of Cerreto.
GloJA, Melchionie, a famons Italian statistician, was born at Piaccnza, 20th September 1767. He was educated for the priesthood, and for some time discharged the duties of tutor in a noble family, but through the liberabity of his brother was enabled to resign this post, and to follow his own hent, which was towards social and economic science. When the invading forees of France descended into Italy, G. had already attracted much notice by his political writings ; and in 1797 he quitted Piacenza for Milan, and was there appointed state historiographer, a post he was deprived of in 1803, in consequence of his work on divorce giving great dissatisfaction. In 1806, he was appoiuted dircetor of the statistical department, and in 1809 the minister Vaccari intrusted to him the preparation of a grand statistical report of all Italy. This great labour was still in progress when a change of government interrupted it. G. died at Milan, January 2, 1820. IIs laborious habits and immense knowledge of the subjects he wrote upon, enabled him to accomplish an incredible amount of labour, but he is justly blamed for the bitter strain of personal invective with which he resented the least unfarourable criticism of his works. Some of his chicf works are: Sul Commercio de' Commestibili e curo prezo del cilto ( 1 lilan, 1802,2 vols. in $12 m 0$ ); Teoria cirile e penale del dirorio ossia necessita, cause mova maniera di organizarla (Milan, 1803, in Svo); Tuovo prospetto delle scienze economiche, ossid somma totale delle idea teoriche e pratiche in umi ramo d'amministrazione privata e pabllica (Milan, 1815 to 1819, 6 vols. in 4to); Filosofia della Statistica (Milan, 182G, 2 rols. in 4to) ; Dell ingiuria, dei danni, del soddisfuei mento e relative basi di stinta (Milan, 1802, 은 vols. in Svo).

GIOJO'SA. a town of Napics, in the province of Calabria, is situated abont 7 miles north-east of Gerace, in a fertile and beautiful district, and is supposed to bave risen on the ruins of the ancient city of Mitra, mentioned loy Pliny. Its air is remarkalile for purity, and its inhabitants for physical vigour and beanty: Pope cestimated at 8485 .

GlORDA'NO, Lecs, an Italian painter, was horn of inporerished parents at Naples, abont 1632; sturlied under Ribrera or Spagnoletto, and made rapid progress. Singularly enough, considering his tine imagination and delicate tonch, both his early productions as well as those of his more mature years, indicate rather a power of beantifully correct imitation, than any marked originality or eleration of genins. On leaving Ribrera's school, G. repaired to lome, where he became the scholar and fellowworker of Pietro da Cortona. Subsequently, he went to Lombardy and Venice, to familiarise himself with the styics of the schools of art there. After some time be proceeded to Madrid, in 1602, at the request of Charles Il., ling of Spain, who desired his assistance in the embellishment of the Escorial. His pleasing freedom of manner and genial humour rendered him a special favourite during his residence at the Spanish court, which he only
quitted for Italy on the death of the king, ten years later. The extreme rapidity of execution for which G. was remarkable, enabled him to produce a pro. digious number of works, but undoubtedly told detrimentally against their excellence. With some blemishes they possess, however, many beanties, and are chictly admirel for their spirited animation of character, and harmonious freedom of treatment, they also excel in bolkess and perfection of the foreshortening. The palaces Riceardi and Pitti contain some fine specimens of this artist's style, but his best paintings are in the galleries of Dresden and Naples, and the Eseorial at Madrid. G. died abuat 1704. The name of Fa prexto, which distmmuisherl him thmush life, referred to his father's incessant injunction to work quickly, in order that the proceds of his latour might releve th. indigence of the family.
GIORGIO'NE, or G1ORGIO BAREARELLI, one of the most poctical and fascinating of ltalims painters, was born about I 478 at Castelfranco, in the Venctian territory of Trevisano. He studied under Giovami Bellini, but quiekly surpassed his master ; for while Bellini's style is distinguished for its minute finish and cramped precisin, that of f. literally revels in freedom and brealth of ontline, and gorgeons depth of colour. Fnfortumately frir art, G. dicel in 1511, at the early age of 33. In is works are of course limited in inmber, lut they are among the must rave aul expuisite examples of the Vemetian school. Scriptural seenes, highly original in ilea ant treatment, portraits, and a few sweet illylhe scenes, representing pastoral concerts and sylvan enjoyments, form the subjects of these pictures, which all glow with the tive magimation, the rich coloming, and the energy of tonch, that are G.'s distinctive attributes. The Lombard galleries and the Lourre possess the best authenticated originals of G., whose imitators were mumerous.
GIO'TTO, or AMBROGIOTTO BOLDONE, a great painter, architect, and sculptor, born in $12 \pi t$, was the son of a poor shepheri, and passed the earliest years of his life in watching tlocks in his native Tuscan valley of Vespignano. Here he tirst essayed to reproduce on a fragment of slate the forms of nature surrousting him, and to the subtle intluences of these early associations may he ascribet much of the devotion which G.'s jerfected works evince towards nature in her purest and most winaing aspects. One of these simple designs, wepresenting a sheep, having fallen under the notice of Cimabue, the latter became interested in $\{x$, , anil having obtainct the consent of the fouth's father, receiver lim into his studno. (i.'s intuitive peretp, tion of the true in art specdily emancipated him from the conventionalitics, although it is true that Cimabue himself hat provonsly taken steps in this direction. In G.'s laintings, however, we first markedly observe insteal of the that clongated forms and lifeless features of the Byzantme types, figures imbued with the varied antion and expression of nature, and exhilpting lessides an ideal elevation and grandeur of character. IIe first also practised the art of gronjing with due regard to the sentiment and action of the composition, and gave simplicity and grace to the drabng outhot ; in short, he effected is profoum reformation in the style of art, which from lis era asomed its rightful allimee with the beantiful in nature. (i. was also an ewinent architect, and was emplowed in the execution of the dome of Flomence, while from his designs the Campanile ( $q$. w.) was built. The beloved friend of Dante, and of all the great souls of his age, be himself presented a rare union of gemius, knowledge, and wit, combined with the uturast.
equanimity of humour and massive good sense. The restorer of fortraiture, his pencil has transmitted to our day the featmes and persomality of his cherished Danto, of l'runcto Latini, Corso Donati, aud other celehrities; and in return we timl his name enshrined with reverence in all the grand literary works of the times, especially in thase of fante, boceacco, and Jetrarea. 'Jhac works of this illustrinus man are too numerons to ha recorded here, but we may mention some of the 1 rineipal. 'The cironation of the 'tirgin,' in the churell of Santa Croce at llorence ; 'A Last sugner,' in the reflectury; the fammens musaid, executed at Fame for lone loniface V1ll., named 'La Navicella, and reprosentime I'efer walking on the waves, a wonderial work, which las whandy sererely sufferen in the sucessive repains it hat required : the freseoes of the "sowen Nacraments," painted at Naples in the church of the Incuronata, one of the most perfect of his works in $l^{n}$ nut of preservation; and the frescoes of Assisi, illustrating the life of 'St Francis, and imnumeralde other minn works. \& died at Flureuer in 1:30, aul was interred in the church of Santa Maria del Fiore, where a marble momment was erected to his homour lig Loremzo de' Medici.

GIOVA'NSI (sar) A TEDUCCLO, a town of 7298 inhabitants, three miles east of Naples, is situated near the sea-shore in a fertile phan. Lis neighbowhoor is well cultivated, and rmbellished with beantiful villas. lts origin is supposed to be very ancient, and its name is attributed to the Emperor Theotusins, whose name is carved on a small ancient colnmon discovered in the vicinity of the town.

GIOYENAZZO, a thriving little town in the sonth of ltaly, $\mathrm{l}^{\text {movince }}$ of Terra Di Bari, is situated on the shore if the Adriatic, 14 miles west-nothwest of the town of Bari. It is consilered the Natolum of the Jomans, and possesses some remains of its aneient walls. In the llth c. it behonged to the Greaks, and eventually lassed into the possession of the dromzaga family. There is here an excellently organised asyhn for the poor, conjoined with extensive juvenile reformatories. 6. is encircled by vineyards and rich plantations of olive, almond, and wher froit-beang trees. Pop. upratide of 7000 .

GIRA'FFE, or CAMELOPARD (Camolopardalis Giruffit, the tallest of quatruperis, ranked by some naturalists among dece (Crribler), lut more $\mathrm{I}^{\text {ro- }}$ perly recarded as constituting a distinct family of ruminants, which contains, however, only one species. It is a native of Africa, from Sinfia to the Cape of (rood Hope extensively diffased, lut aplarently nowhere ahmodant. It neturs mamally in small lyerls of from tive to forty. It feeds on the leares amb small lmanelses of trens. Its rencral aspect is remarkahle from the hoight of the forprarts and great elongation of the nock, the head heing sometimes is feet from the gromm? The number of vertelow in the neck, lowever, is not greater than in wher qualrupeds, aud it has no extrandinary liexilility, althongh its fom and movements are very graceinl. The borly is short, and the hack slojes from the shomle to the tail; lut the greater leeight of the foreparts is not owing, as has been often alleged, to the greater length of the fore-legs. whith are not really longer than the hind-legs, bint to processes of the vertebre, whieh form a basis for the muscular suphort of the neck and head. The articulation of the skill to the neek is such that the hearl can be casily thrown back until it is in the same line with the neck, thus giving the aumal additional 1 ower of reaching its

## GIRAFEE-GIRALDUS CAMBRENSIS.

apmopriate food. The skull has emptry eavities, which give lightness to the bead, alonge with sutticient extent of surfice for the insertion of the ligament which supports it. The less are lons and slember: the feet have cloven hoofs, but are destitute of the

small lateral toes on spurions loofs, which ocen in the other clowen-fontenl ruminants. The heal is long ; the "uner lipentire, projecting far beyon the nostrils, and mowed with consiticable muscular power. The tongue is ramarkably calable of clumgation, and is an wgan of tomeh ind of prebension. Fike the trumk of an chephant: it can lee thonst far ont of the month, and enplofed to crasprand take up even verysmall objects ; it is sain! that its tip can le so tapered as to enter the rime of a very small key. The usefulness of such an urgan for drawing in leaves and hanchlets to the moith is obvions. The (1. aulroitly picks wif the leaves of acacias ame other thorny $f^{\text {lants, without taking the thems into its }}$ nomth. The dentition of the $\mathbb{G}$. agrees with that of antelipes, shep, goats, and oxen : the mpre jaw of the mate is destitute of the canime texth, which are present in the male of most kinds of deer. The heal is turnished with two renarkalide protuberances between the ears. generally deseribed as homs, hat vory lifferent from the homs of wher amimals, and each consisting of a hone united to the skull ley an obvious suture, permanent. covered with skin aml hair, and terminated hy lone has loristles. There is also a prajection on the forchead. The ears are moderately lons: the tail is long, and terminates in a tuft of lunis hair that nearly reaches the gromed. 'There is a callowity on the limeast. The neck hans a sery short mane. The hair is short incl smouth; the colour is a redilish white, marked by mumerons dark rusty spots. The eye of the di. is wery large and hastrons, and so phived that the animal cat lowk all aromol withont turning its hean. so that in a will state it is not easily apmomed. Its nostrils have at mastle ly which they can lee closed; a puvisum, as Gwen surposes. for excludins particles of sambl. It is an imoflensive animat, and generally sceks safety, if possible, in flicht, althongh it is eaprable of making a strut resistance, and is said to leat ofl the lon. It lights hykicke with its hinatlegs, discharging a storm of kieks with extaoudinary rapulity. It is not casily overtaken even by a fleet horse, and has greatly the alvantare of a horse on moven and lroken gromul. Its pate is described as an amble, the legs of the same side moring at tho same time. The fi. was known to the ancients, and was exhibited in Immen spectiveles. depresentations of it arpear among Egyptim antiquitits. It has
heen suppused to be the zemer of the Jews, translatel chamois in the Enylish Bible (Dent. xiv. 5). In the year 1830 , giraffes were anded to the erollection in the Zondogical damens of London, amd interesting oppuntmities of studying their habits have since been enjoyed. They are fed chienly on hay placed in hiol racks, greatly enjoy carrots and onions, and a houp of shar is a favourite delicacy. They have hred in Entund. The flesh of the $G$. is sail to be pleasant, and its marrow is a favourite Afriean delicacy.

GILALDES (ADHBENSIS, the literary nane of Gerald de liarri. The was fourth som of Willian de Parri, a Norman noble who hal sattled in Pembrokeshire, and allied himself by marriage to the fanily lihys ap Theonlor, wince of Sonth Wales. G. was hrim about $11 \mathcal{H}$, and equeated by his uncle David, who wis Bishop of St David's. He entared the uniwersity of l'aris in his 20 th year, and after three years of much literary distinction he returned to Ensland, entered into holy orders in 1172, and was sinm afterwards appointer Arebdeacon of St Divill's. He was from the first a zealous churchman : strennous in the enforcement of discipline, and especially of clerical celibacy; and was the chiof agent in the estallishment of the pryment of tithes within the mincipality. On the death of his uncle, the chapter of St David's elected him lishen; lnat as the clection was made withont the reryal license, $G$ renounced it. The ling, Henry IL., directed a new election; and on the chapter's persisting in their choice of G., the king refused to ermfirm the selection, and another bishop, Piter de Leia, was appointech. ©., withdrew for a time to his old residence in the university of Paris, and on his return he was required, by the Arehbishop of Cunterbury, to take the administration of the diocese of St Davils, which had utterly failed in the hands of De Leia. Hhe heh it for four yours, when heing appointer a royal chaplan, and afterwards preceptor to Jrince John, he accompanici that prince in 1155 in his expelition to Treamd, where he remained after .Tohn's return, in orter to complete the well known eleseriptive account of that country, which, ilthough very valualike as a whole, has in many of its cetails ealled forth much angry criticism from Irish scholars and antiquaries. On his return. in 1187, le read this work pallicly in the university of Oxford, giving a full day to each of the three divisions of which it consists. I tour of Wales which he made (1185) in the company of Ealdwin, Archbishop, of Cant mhry, Lel to a sinilar descriptive work, the Itimarimm Cumbria. In the following year he acempanied the king to France, where he remained till the kings death. His later yeurs. after his return, were full of disappintment. On the see of st Havid's again becoming vacant, he was again unanimously electel by the chapters; hat the Arehbishop of cianterlnery having interposenl, O., notwithstanting an appeal to Fonue, in prosecuting which he made three different journeys in the compse of five sears of the contest. failed to obtain a condirmation of the momination. IIe soon afterwands resigned his archedenenry, and deroted the romaming scemtern years of his life to study. Once again the see of st Invid's becme vacant,
 tions, he declimed to accept it, and lied at st Davil's in the 7th year if his age. The reason why (t.'s appointment to the bishuric was so much apusen is not clearly known, hat the king. it is saild. hav! resulped that no mative of Wales shomid obtain the dignity. (i.'s writings, although distigured loy credulity, and in the persmal narratives with which they abound, by excessive ranity, are of great value as materials for the history; and
for the social condition of the ago and the comatries which he describs. But they must le read with much caution, and with a careful eritieal consinderation of the somrees of the information which they embory. Several of his works are still preserved in manuseript in the Litinh Muscum, the Bonleian, the Lambeth, and Corpus Christi College Dilmanies. llis printed works are the Itiurctritu ("umbries:
 Doseriptios C'ombrior; aul several smaller piceeses which are printed in the socomel rolme of Wharton's I molies Sucrt. larry's work on lietime called out several rejoinilere, the buth valuable of which is that of John Lyerth (unter the parmongm of Gortianus Lucius), cititloml (iembon usia Liensins; a less valuable work is that of Nephen White, recently $\mathrm{p}^{\prime \prime}$ hished, from the oriminal manuscripts; Sir Jankes Ware has frety criticisen binty in the Andiquitios of livhord.

of which the creature seems to he propelled in the water. It exhibits lovely irilescent colours ly day, and brilliant phosphorescence hy night. Its substance is so delicate, that a perfect specimen can with difliculty be olotained.

GIRGEH, the third largest town of Egrpt, is situated on the left bank of the Nile, in lat. $26 \quad 20^{\prime}$ K., aud longe $31^{\circ}$ 万s' E. It was here that the aliscontented Mamelnkes rallied against Nlohammed Ali. It contains eight handsome mosques, a large mazar, and a cotton manufactory. The population is about 10.000 , of whom 800 are Cluristians, and it has a convent of Catholic missionaries.-Clot Bey, Aperat Gínárale sur l'Etmpte, i. p. 214.

## GIRGE'NTl. See Agrigentcos.

GIRL, in Heralary, is the term used to signify the ymug of the roe in its second year.

GI'RNAR, a sacred mountain in India of most remarkable aspect. stauds in the peminsula of Kattywar, which forms part of the native state of Guzerat. in lat. $21^{\circ} 30^{\prime}$ K., and long. $70^{\circ} 42^{\prime} \mathrm{E}$. Above the mass of luxuriant hills and ralleys which surrombl its base, rises a bare and black rock of granite to the height of about 3000 feet above the sea. The summit is broken into varions peaks, its northern and southem sides being nearly perpendicudar. An immense bonluler, which seems to he puised on one of the scarped piunacles, is called the Beiru Jhap, or I eap of Death, from its being need by devotees for the purpose of self-destruction.

GIRONDE, a maritime department in the southwest of France, is formed out of part of the chl province of Guienne, and is bounded on the W. loy the Eay of Biscay, on the N. by the department of Charente-Infericure, on the E. ly those of Fordnane and Lot-et-Garonne, and on the s. liy that of Landes. It has an area of 4133 square miles. and a ${ }^{\text {wepulation of }} 640,757$. It is watered mandy by the Garonne and the Dondague, and ly the Gronde. which is furmed by the mion of these two rivers. The surface of the land is in general flat: but in the east there are some hills. The chimate is temperate, and except in the Laodes or sandy tracts. which, however, occupy nearly all the western half of the department is healthy. In the east and north-east the soil is chietly calearenus. Wine, includins the finest clarets, is the great product of the department. The priucipal grow the are those of Latitte. Latomr, ChateauMargitux. Haut-Brion, Santerne, Barsac, and the Vins de Crave, and the quantity proluced annually averases $44,000,000$ gallons. Grain, regetables, fruit, and hemp are also produced largely. On the west coast, on the downs or sand-hills, there are extensive plantations of pine, from which turpentime, pitch, and charcoal are obtained. The sleplicres of the Lawdes travelse the sands on high stilts, and travel with them also to markets and
fairs. Among the manufactures, salt, calico, moslin, chemical prolucts, pottery, paper, vinegatr, aud lirandy, are the chief. Bordeanx is the canital.

GIRO'NDIsTA (Fr. Girondins), the name given during the Frenoh lievolntion to the moderate republican party. When the Legislative Assembly met in October 179, the Gironcle department chose for its representatives the advocates Vergniand, Guadet, Gensonné, Grangenerve, and a yonng merchant named Ducos, all of whom soon acquired great influence by their rhetorical talents and political [rinciples, which were derived from a rather hazy notion of Grecian republicanism. They were joined by Brissot's party and the adherents of Tinland, is well as by several leaders of the Centre, such as Coudorcet, Fauchet, Lasource, Isnard, and Henri La Riviere, and fur some time had a parliamentary majority. They first directed their efforts against the reactionary poliey of the court, and the king saw himself compelled to select the more moterate of the party, Roland, Dumouriez, Claviere, and Servan, to be ministers. Ultimately, however, he dismissed them. a measure which led to the insurrection of the goth June 1792 . The encroachments of the polulace, and the rise of the Jacobin leaders, compelled the G. to assume a conservative attitude; but though their cloquence still prevailed in the Assembly, their popularity and jower out of doors were wholly gone, and tley were quite mable to prevent such hideous crimes as the Sejtember massaeres. The principal things which they attempted to do after this-for they never succeeded in accomplishing anythingwere to procure the arrestment of the leaders of the Septemler massacres, Danton, \&c.; to overawe the mob of Faris by a guarl selected from all the departments of france: to save the king's life by the absumdest of all prossihle means, viz., ly first voting bis death, and then by imtending to appeal to the nation : and, finally, to impeach Nlarat, who, in thm, induced the varius sections of laris to demand their expulsion from the assembly and their arrestment. This demand, backed mp as it was hy 150 pieces of artillery under the disposal of Henrint ( $\mathrm{q} . \mathrm{y}$ ), leader of the sans-culottes, conld not le resisted: thirty of the $G$. were arrested on a motion of Couthon, hat the majority had escapeal to the provinces. In the departments of Eure, Calvados, aut all through Brittany, the people rose in their defence, and under the command of General Wimpfen, formed the so-called 'federalist' army, which was to rescue the republic from the hands of the I'arisian jopmace. Novements for the cause of the G. took jlace likewise at Lyon, Marseille, and bordeanx. The progress of the insurrection was, howerer, stopred by the activity of the Conrentim. On the coth Inly, the revolutionary army tnok fossession of Caen, the chief station of the insurgents, wheremon the deputies of the Convention, at the head of the sans-culottes, forced their way into the other towns, and commencel a fearful retribution.
On the Ist Octuber 1703, the ]risoners were accused before the Convention by Amar, as the mouth liece of the Committee of Public Safety, of conspiring against the repullic with Lonis XVI., the royalists, the Duke of Orleans, Lafayette, and Pitt, and it was lecreal that they should be brought before the Fievolutionary Tribmal. On the 1 thth, their trial commenced. The accusers were such men as Chabot, Hébert, and Fabre dEglantine. The G., however, defended themselves so etfectually, that the Convention on the 30th was obliged to come lorwarl and decree the closing of the investigation. That very night, Brissot, Tergniaud, Gensonné, Ducos, Fonfrèle, Lacaze, Lasource, Valazé, Sillery,

Fauchet, Duperret, Carra، Lehardy, Duchatel, frardien, Boilear, Beauvais, Tigée, Duprat, Manvielle, and Antiboul, were sentenced to death, and, with the exception of Valazé, who stabbed himself on hearing his sentence pronounced, all perished by the gnillotine. On their way to the Place de Greve, in the true spirit of French republicanism. they sang the Marspillaise. Constard, Nambel, Cussy, Nocl, Kersaint, Rabaut St Etienne, Bernarl, and Mazuyer, were likewise afterwards gullotined. Biroteau, Grangenenve, Guadcet, Salles, and Barharoux ascembed the seafold at bordeaxx: Liton and Chambon, at Brives; Valaly, at Périguenx ; Dechézean, at Tochelle. Rebeequi drowned himself at Marseille, Fétion and Buzot stabled themselves, and Comdoreet poisoned himself. Sixteen months later, after the fall of the Terrorists, the ontlawed members, including the G. Lanjuinais, Iefermun, I'ontecoulant, Louvet, Isnard, and La livière, again appeared in the Convention. A rather dattering picture of the party has leen dramn by Lamartine, in his Mistoire des lierontins (8 vols., Paris, 1817 ).
GIRONNE, GYRONNE, GYRONNY (Latin, garus, a circle), terms usch in Heraldry to imdicate that the Field (q. v.) is diviled into six, eight, or more triangular portions, of different tinctures, the points of the triangles all meeting in the centre of the shield. Nishet (i. 2S) mbjects to this as a valgar morle of llazoning, and, in speaking of the 'paternat ensign of the ancient sumame of Campbell,' he says (p. 31) that it is cumposed of the four principal partition lines, parti, conpe, trannelé, taillé, which divide the lield into eight gironal segments, ordinarily blazoned with us girony of eight, or, and satile.' The triangle in dexter-chief has been called a (iiron or Gyron.

GI'RVAN, a scaport town aml burgh of harony, on the west coast of Scotland, is heantifully sitnated at the month of the river Girran, in the comnty of Ayr, and about 21 miles sonth-west of the town of that name. It is now the terminus of the Glaspow and sunth-Western Lailway, and owns consilerable tomage in shiping. The harbom has been much improved of late, and a consilerable trade, especially in the shipment of coal, is earrien on betrixt G. and Fedfast, from which it is distant about 6 miles. The valley of the Girvan is one of the must beantifnl and liest cultivated districts in the sonth-west of Ayrshire, and abounds with coal and with limestone. The lanil is of the richest description. The tom is sitmated oplosite the celcbrated "Ailsa 'ralis', and has hecn much frequented of late in the summer season lay partics in quest of sea-bathing, for which the coast is admirahly adapted. Iop. (1561) 7047.
Glsors, a town of Framed, is the department of Eure. situated on the river Epte, $0: 3$ miles borth-east of Exreux, and on the high-road irom laris to Ronea. Pop. siz45. Jlere a hattle took place, luth Octoher 1198, between the Freneh and linglish. in which the former were completely defeated. Richard I., who commanded the English, gave, as the 'barole', or watehwort of the day, Bicu ct mon Druit (God and my Right), and ever since, the expressim has been the motto to the royal arms of England.
GlUL1'N, Gomisw, a learned historian and antiquary, was lom at Milan in 174. He studied law at the university of Padua, and received the degree of Doctor at an carly age. G. devoted his decided antiquarian genius to researches into the monuments and remains of his native land: and after twenty years of patient labour, he published a valuable historical work, entitled Memoirs concerning the Government of Milen, with

Description of the rity and Milanese Territory from the E'arly A!pes. These Hemoirs, in 4 vols., enibrace the ferion from the destruction of the Lombard domination, or establishment of the Franks in Italy, down to the opuening of the l4th century. In three sulsequent hooks, he desconds to 1447 , when the House of Visconti was clerated to sonereig rule in Milan. The work is considered loy (i.'s countrymon a master-pieer of learning impartiality, and julgment. Much of the history is based nipon the evilence of cons, seals, documents, and montments of the rarions ages. Milan proudly recognised G.'s patriotic labour ly apmointing lim state historian, and, at the request of the Limpress Maria-Theresa, be collected materials for four additional books, with the view of bring ing the work down to the lith century. Before achiering this design, he died of apolexy on (hristmas Live, in 1780 . G. was listinguished for active benevolence as well as learming. He likewise enltivated with enthusiasm both poetry and music.

GIULIO PIPPI, surnawed 'liomaso, from the place of his birth, was born at liome in 1492, and became one of Japhad's most distinguished and belored pupils. His excellence as au architect and engineer almost equalled his genins as a painter. $G$. assisted Raphael in the execution of sereral of his tinest works, and by special desire of the great master. he was intrustel with the completion of all his notinished designs after his death. He likewise inherited a great portion of laphael's wealth. The works excental by G., in imitation of liaphael, reflect so wonderfully, not alone the style and character, but the sentiment and spirit of the original, that in many instances uncertainty has arisen as to the hand from which they cmanated; while, on the contrary, the more original creations of Gr. are detieient in the ideal grace of his master, and display rather lrealth, and power of treatment, and boldness of imagination, than petical refinement or elevation. Unlike Ihabael, the chief exedlence of G. does not lie in his cmencition of the divine or Christian, but rather of the clussical ideal. G. died in linto.

The primipal architectural works desinmed by G . were executcal at mantua, daring his lengthened residenee at the court of Duke Fralerick Gonzaga. The drainare of the marshes surrounding Mantua, and the sembins the city from the frequent inundations of the river: Po and Mincio, attest his skill as an engineer; while his genims as an architect found free scope in the resturation and adormment of many of the ehief publiceditiees of Mantua, and especially in the crection of the splendid palace known as 11 Palazzo del Te, which he also embellished with mytholonical frescoes, and a profusion of exquisite decorations. Dlauy of G.'s tinest pinctures passed into the possession of Charles I. uf Euyland, who 1urchased, in 1629, the celebrated collection of the Dukes of Mantua. Several of them are now contained in the llamptnn Court Gallers: but the finest of all. a 'Natirity;' was suld to France, aml now ahbins the Jomvre. The Naples gadlery of Capi d'0 prat possesses a Holy Family ly G., called the 'Makma della Gatta,' and considered the ereatest of his pictures; it is strongly inhlued with the spirit and intlnence of Raphatl. The laggia of Tayhacl, in the Vatican, also containg some fine frescnes executel by G.; and in the Palazzo Farnese there is a grand frieze attribnted to him.

GIUIGGEVO, an important traling town of Wallachia, is situated on the left bank of the Tanube, directly opposite Rustelnk, and 40 miles sonth-sunth-west from Bucharest, of which town

Gill"STI, Gicserpi: the most colemated and mpular of the molem poets aul satirists of Italy. was lorn in 1sid), at Pescia, in the vicinity if Flornere. Sprung from an influmentiol Tuseni family, $f$. was early destined to the las, and at listoia and Licea commencel the weliminary stnifies. which were enmplated at the university of liza, where the abtaimel his degree of Moctor of Laws. Nutained camestness of stmy seems to have formed no feature in fr's colloriate course. whose natural bent rather inclined hin to a genial participation in the froaks ant sociat pleasure of his eompanions than to the ernitite incestigation of the P'andeets. On quittine l'isa, $\mathrm{O}_{\text {I }}$. was dmaciled at Florence with the eminent atvocate Capoquadri, who sulsegnently becanc Dlinister of Justice, and here be first attempted poctry. Lyrical empositions of the romantie school, exincine both elerated and nervms thonght, were his carliest efforts: but he sperdily comprebented that satire, not itealism, was his true forte. In a pre-eminent decree, $\mathbf{C}$. possesses the requirements of a great lyrieal satirist-terse, clear, and brilliant. he depiets, alternately with the foignant regret of the humantarian, and the mocking laugh of the irunist, the decorons shams and conventionat viees of his are. His impratiality only lents a keener sting to his demmeiation. The stern Hagellation of tyrants, he is no less merciless in stigmatising those whise phiant servility belps t" ]eructuate the abasement of their country: Nor dres be atulate the reople, whose champion he avowedly is, anl whose follies and inconsistencies he indicates with the faithinlness of a watchful frient. The writings of $G$. excreisel a positive political intluence. When the finctions of the press were ismored, and freedum of thought was treason, his flaning verses in mamseript were throuchont all Italy in general cireulation, fonning the liatren of foreig despots, and powerfully assistel in preparing the revolutionary insureetin
 the prandunym of 'The Anomymons Tuscan.' and append his mame to a volume of forses bearing on the events and aims of the times. All his compusitions are short pieces, rarely bumsherl with 1 wromahties, and writton in the purest form of the fopular Tuscan dialect. The clerant faniliarity of idiom which constitnt"s wat of their chief and original leanties in the eyes of their native readers. presents great difficulties to forcimers, and still greater to the translator. G.'s writings are not only Italian in spirit and wit, hat essentially Tusean. A reverent sturent of Dinte, G. hinself often raches an almost Hantesque sublimity in the higher outbirsts of bis scomful wrath, while he stands alone in the lighter flay of irnonical wit. In prolities, an mblightened and minterate tiberal, averse alike to hurcaucracy and molncracy, (\%. was also beloved in private tife for his swial qualities, and his lowine and sentle spirit. He died in 18:0, aqua 41, in the dwaling of his attached friem, the Marquis dino Capponi, at Fhorence: amt the throng of citizens who followell him to the prave, in the teeth of Anstrian por hinition, attested elnfuntly the repute tre enjusen in life. His most celchratel pieces are entitled Stivale, or the History of a Boot (Italy), a humorche narration of all the misfits, ill-nsage, and latchin't allutted to this unfortumate down-troded
symbul of his comntry; Ginuillino, a master-piece of sarcasm, portraying the ismotle career of the syempant, whose supple lack and petty diplomacy finally secure for him the lichest distinctions: il he Travierllo, on King Lng, the subject of whieh is imlieated liy the title: Il Prindisi di Girelle, or the Weathercock's 'Toast, one of his hest preees, dedicated to the sugustive name of Talleyrand; and the Dies Lier, or Funeral Oration of the Emperor Fraucis 1. The only authorised and correct alition of his works is thiat pullished at Florence in 1852 by Le Monmer.

GIUSTINI.'NI, an illustriovs Italian race, to which the repmblics of Venice and Genoa owed more than one doge. One of the palatial residences of liome was erected towards the end of the 16 th c. Iy a descemdant of the family, the Marquis Cinstiniani. The site he selecter for the palace was a portion of the ruins of Nero's baths, and on its completion he enriched it with a magnificent private sallery of paintings, amd a fime collection of sculptures. Ile also formed a museum of antiquities, the trensures of whieh were discovered on the spot. In 1som, the $G$. family conveyed the collection of paintings to Paris, where they disposed of the greater part loy anction, and privately sold the remainder, consisting of 170 tine paintings, to the arti.t Bonnechose. Wha, in his torn, resold them to the king of Prussia. This fragment of the famons Giustimian Gallery now enriches the Berlin Maseum, and a very fow of its former treasures are still to be fomil in the Giustiniani palace at Fome.

GIVET, a town of France, and a fortress of the first rank. is sitnater in the iepartment of Ardemes, on both banks of the Mense. close to the border of Belgium, and 14,5 miles north-east of Paris. The town consists of three ,listricts-Charlemont, Circt st Hilaire, and fiset Notre Dame, all lying within the line of the fortifications. It is well situated in a commereial poiut of riew, is regndarly built, has bandsome squares, a good port. barracks, a military hospital, and manuiactures of leather, for which $G$. is famous, of white-Jeal. clay-pipes, sealing-wax, and mails : hreweries, marble-works, and a zine and copler fondry are also carricd on. Top 4136 .
GlTORS, a town of France, in the department of Thone, is situated on the right bank of the river of that name, 14 miles sonth of Lyon. Bottles and wiudow flass are bere extensively manufactured, and a trade in ironstone and coal is earried on. Tup. s.ias.

CLACIER is a name given to immense masses of ice, which are formed above the sunw-line, on lofty monntains, and deseend into the valleys to a greater or less distance, often encroaching on the eultivated regions. The materials of the glaciers are derivel from the snow which falls during summer as well as winter on the summits of hide mountains. Erery fresh fall of snow alds a little to the height of the momntain, and, were there no agents at work to get rid of it, the mountains would be gradually rising to an indefinite clevation. Aratanches and glaciers, howcrer, carry the snow into warmer reqions, where it is retuced to water; in the me, the snow slips from the steep mountain slopes, and rushes rapidly down; in the other, it gralually ilescends, and is converted into ice in its progress. The snow which forms the glacier at its origin has onvy different appearance and cunsistence from the ice of which jt comsists at its lower termination. The minute state of division of the ice, in its snow condition, ant the ruantity of air interspersed throng it, gives it its characteristic white colnur. Two canses operate in cansing this change into iee: first, fressure expels the air, by

## GLACIER.

bringing the partieles of the lower layers of snow more closely tofecther; and sucond, the summer's heat meltiner the surface, the water thas ohtamed pereolates through tho mass lencath, and as it passes amongst the particles whose temperature is holow "32' li, it increases thrir size by extermal additions till the particles moet, furd the whale becomes in solid mase. The sumy re fion of the

Gincier on the $A n^{\prime}$.
Giacier is called by the French name nor. Ia latece glaciers, the neve is of great cxtent, a larse quantity of material locing requirel to make up thr waste. 'The néve is, however, often contined to narrow valleys, ami, as a monscupence, proluces placiers which soon perish. The increase of a glacier by snow falliner on its surface takes place only abowe the snow-line-below that line, all the acemmulated winter's snows are speedily melted hy the summer's heat. The ice of the ghacier selfom exhibits ary traces of the horizontal stratification which is fommil in the névé, lat is generally intersectel with vertical veins of clear bluc ice.

The most remarkable feature of slaciers is their motion. It has been hones known bo the natives of the Mps that they move, lut it is only within the last few years that it has receivel due attention from seientific 1 n'n ; the acoont of their observations, and the theories hased apon them, form one of the most interestimp chapters in the history of whaciers. See the writings of Arassiz, Fortus, and Tymall. The continual waste of gheme ledow the snow-lime, hoth alone its suffecend at its cxtremity, is ever leing repaired, so that the wheier does not recele from the wallev, nor lecrease in depth. That the materials of the reparation are not ileriven from the fall of the winter's sumw, and the influence of the winter's frost, is evident, inasmuch as thase ahlitions specelily disampear with the seturn of the summer's leat, imm in the end form hut it small moportion of the years thtal lows. The true repaining agent is the motion of the olacior, which bring down the glacified swow from the unter regions to be metted below. To account for this motion, Charpantice supposed the water which saturated the glacier in all its parts, mol fillet the inmumerable capillary fisolues, was, hurime night and during the winter, frozen, and that the wellknown aud almost irresistille expansion which would take place in the conversion of the water into ice, furmishen the foree nomessiry to move the ghacier forwards. This thom, known as the ditute fun theory, was for some time alopted ley logssiz, lut ultimately alandoned. Agassiz shewed that the interior of the flacier hall a temperature of $: \mathrm{BP}^{\circ} \mathrm{F}$, and subsequat observations have shewn that the glacier moves more rapidly in summer than in
winter. In 1799, be Sanssure pmblished a seemed theory, known as the groritation or slidiny thomy in which he smposed that the ghacier moveri ly sliting down the inclinel plane on which it rested, and that it was kept from adhering to its heal, and smetimes rven clevated by the water meltend in the contact of the glacier with the naturally wamer carth. While correctly attributine the motion to gravity, Ihe sumsure crred in considntins ulaciors iss ean timous and more or less rigid solits-imbed, the motion he aftributes to then wonld, if commenced, he acelerated by gravity, aml dand the ulanior from its 1 ed as an avalanche: I'rineipal forbes was the anthor of the next important theory. Comidemble attention had in the meantinge leen pail to the subject hy licmen, Agasize and otherso Remelu hat
 like motion, in expaming the differnce hetwon ascruations made ly him at the econter, which "moves more rapilly, and others male at the sides, "whew the ier is retamed ly the friction arainst its rocky wallo.' 'Thar resulis hased on lientu's whervations wre establishen ly the repated and exact meaturements of Forbere, who, in the promerss of his "xaminations, male the further disworeres, that the surface noves more rapidit than the ace near the hotem, and the mildle than the sikes; that the rate of motion is ureater where thes glacier-hed has the ureatest inclination ; and that the motion is contimes in winter, while it is accelerated in summer by the incrais, of the temfurature of the air. 'The only theory which, as it
 mon is thas expresserl by him: "A glamer is an imperfect flain or a viscoins borly, wheh is ment down slopes of a certan inclination ly the mataral pressure of its parts.' 'This is known its the riseomen theory. He comsidemed atacier as not a "rystathme sulitl, like ice tranquilly frozen in a monll, hat that it possessen a peculiar fissured aml lammated stru"thre, thrunch which water contered into its intrinsies ommusition, riving it a vischel consistence. similar to that possessen ly treacle, hmey, in tar, lat dithering in degrec: Professor Tymball has phatished mother thems, which he werimates the phesseme theory This differs little from that of Forless. "xeept that it rumis that oflucer fee is in the least viscial. bya mamber of indepmentobservations, ha* astahlished the facts tirst notieed by Remda amel Forbes, amb added the imprtant one, that the phace of pratust anotion is mot in the centre of the glacirs, hat in a chre amo deppy simons than the valley itsolf, crossing the axis of the glacier at cach point of contrary flexure-in fact, that its motion is simila to that of a river whose puint of maximm mation is mot central, lont deviates torwarls thent silp of the vall river turns its combex bomdars. 'Jhis secmes a further cormburation of the visoons theory, bat Tymall explaneel it and the other fincts loy a theory which, while mantanin's the quensi-fluid motion of the glacier, denied that this mution was owing to its being in a viscons combithm. The grom of his themry, as hate tells us, was derived from some observations amd expriments of Faralay's in init, who shewel, "that when two ricees if ice, with manstenel surfaces, wore plitend in contact, they became cementod tusther hy the irewing of the film of water between them, while, when the ice was how : $\mathbf{H}^{2}$ Fo, and therefore an, no effect of this linal eombl be proluced. The ireesing was also found to take jace under wator.' By a further series of experiments, Tymbill fomm that ice at $8_{2}$ F. comlat be compressed inter any fom, and that no matter how dreat the lnusing of its barticles and the change of its shape, it wond, from this property

## GLACIER.

of requtation, reestablish its contimnous soldil condition, if the praticles of ice oprated on were lept in close contad. These facts le aplliad to the mothon of gholers, asserting that the lressure of the parts of a glacier on each otluen, in ib thownard direction, produced hy smavitation, was more powerful than the attraction which beld the purtirles of the jue towether-that, consequently, the ice was ruptured, to permit the motion of the nacios, the partioles boing, however, speedily remiterd by regelation. The simposed viscous combition of ice he Lelieved to be refuted by the fact that, whenever the glacier is subjected to tension, as in passing over a cascade, it does not vicld lyy stretching, bout always by breakiner, so as to form crevasses. This
 knewn phenomena of glaciers, while the alvantage is elamed for it of not drawing upon our imagination as to a reguircd condition of the ice, lat, by experiment, exhibiting ice from known canses problueiner diteets on the small sale similar to those protuced in nature on the lage. Forbes, however, maintains (Sccusimul letpens, \&c., 1859) that all that is peculiar to 'Tymlall's theory was included in his wwn ; and that the facts discovered and expounded by Faraday in 1550 had alrealy been used by him as prart of his theory in 1846 . He says that his viscons theory meluded the notion of an infinity of minute rents; that it also embraces the sulostitution of the finite sliding of the internally bruised surfaces over one another ; and that it inclucles "the reconsolination of the bruised glacial sulnstance into a coherent whole by pressure acting upon ice, softened by imminent thaw.'

Trofessor Tymall re-introdnces and re-asserts the gravitation theory of De Saussure as in part the canse of the glacier's motion; but the phenomena which he considers moduced by a sliding motion of the whole mass over its bed-vir, the polishing and grooving of the rock below-can be produced by a substance whose motion is the result of a veluling of its parts, if that substance has sufficient consistence to retaiu tirmly imbedded in its lower surface jumtions of rock to act as polishers, nut it camot be doubted that the ice of glaciers has such a consisteney.

Some of the more remarkable phenomena of aluciers lemain to be noticed. The surfice of the Glabr does not long retain the pmity of the snow from which it is derived, but is specdily loaded with lone ridges of débris called moraints. The monntains which rise on either side of the valley ncelibed hy the glacier are continumby suffering loss from the action of the rain, disruption by frost, and the impulse of avalanches. The mate rials thus Liberated find their way to the glacier, and form a lino of rock and rubbish on its two larders, of srmater or less size, depondent on the friability or compactness of the adjacent monntains. The leterul morrines often reach to a sreat height, as much as forty or lifty fect above the level of the Hacier. The whole ridge appears to consist of Thbris, but it is really a rilue of ice with a covering of foreinn materials, which, by protecting the maderlying ice from the lueat which they rabliate and only partially transmit, leave the morange as a more anil more elevated ridge, while the surface of the glacier is speedily melting. Glacier tublos have a - imilar origm. A large and isolated mass of rock, restine on the glacier, protects the ice helow : and as the whaier mults, it leaves the rock poised on the smmmit of an iey column. As the rays of the sum blay on the table all day obliquely, the column is STalually melted from under the roek, until it slips wff, and begins to form another table; while the unpotected colmm speedily melts and chisappears.

Where two daciers unite, the trails of rock on the inner margins mate also, and form a single rilige, which russ allung the midnle of the large trmik yracier, and is called a matial morkine. It is evident that the number of the menlial moraines must thas apenel mpon the nmmber of the branch glaciers, and mast indecd le inviariably one less. The glacier terminates amidst a mass of stones aml debris, wheth havine been carricd down on its surface, are finally doposited by its melting at its extremity, fornnug there a trrminal morame. Sonetines a glacier ducreases in size, either withlrawing from the valley, and leaving the terminal moratue as a barren waste of rocks, or melting on its superficies throughont its length, and depositing its luteral moranes as a ridge of debris on cither side at some beight above it on the monntain. The existence of such collections of rucks is plain evirlence of the former position and altitude of glivelers, and even of their fommer ocurrence in conntries where they are now unknown.

It has been stated, that when the glacier is subjected to tension, the contimuity of its parts is destroyed, and fissures, called crubusses, are formed. In bassing over a lnow on the channel, the ice mvarially yields; at tirst, a deep crack is formed, whicl gradually wideus matil a tissure or chasm is produced across the glacier. Transverse crevasses disalpear when the glacier reaches a level portion of its lied: the presstre lringing the walls again together, the ehasm is closed np. Longitudinal crevasses are prodnced when the grlacior escapes from a continerl channel, and spreads itself over a wider area. 'Jhe spreading of the margins canses $a$ tension in the bonly of the glacier, which yiekds, and longitudinal tissmres are formed. These occasionally reud the terminal front of a glacier. The smaller marginal crevasses are formed from the teusion of the ice, produced ly the normal motion of the glacier locint retarded by the friction arainst the sides of its chamel. The motion of the glacier is gradually aceelerated from the margin inwards, consequently the limes of greatest tension are inelined downwards and towards the econtre, more or less, in pronorion to the rapidity of the motion. The crevisses formed by the yielding of the ice ore at right angles to the lines of tension, and consequently point up the dacier.

The reined structure is apparently the result of pressure. The veins consist of blue ice penetrating the white mass of the glacier, amd ocemr either in irregular directions, or prodncing a regularly laminated structure. The blue rems are portions of ice from which the ain-hubbles have been expelled, and which are conseguently more compact than the general sulostance of the glacier. The pressure is exerted in three directions, producing vems which are complementary to the three kinds of crevasses which have just been noticed. When the glacier passes over a level, or perhaps a gently rising chamel, transverse veins are formed; when it is pressed throngly a narower channel, longitudinal veins arc prorluced; and the pressure at the margins prodnced by the retardation of the flow hy friction canses the formation of marginal veins in the lines of greatest pressuce, that is, at right angles to the marginal crevasses.

The melting of the ice on the surface of the glacier produces streams, whose course is often Broken by crerasses, down which the water descends, finding egress at list throngh the eavernons month at the termination of the glacier, where it issues after being increased by other streams, which have by similar channels reached the bottom, as well as by the melting of the ice from the contact of the earth. Tho mishing water wears a sliaft of greater

## GLACIS-GIADIOLCS.

diameter than the crevasse, and this shaft often remains after the margins of the crevasse have been reunited. In the prosress of the placier, another crevasse intersects the led of the stream, amb down this the water is diverted, leasing the formed shaft or moulin, as it is callenk. The forsaken moulin has at its base a quantity of earth and stones collected by the stream from the surface of the glacier; these are gratually rais.mb to the surface by the melting of the glacier, ami eventually ajpear as cones of defnis, sometmes rising hioh on enhmons of iee mbler the same intluences as the placior tables.
Glaciers are mut necussatily fifculiar to any country or zone, but wherever there are momatains of sufficient height, it may be expected that they may exist. In liurne, they are chitly eontined tir the Alps and Noway. Having their origin in the region of perpetual snow, they reach fat clown into the valleys, the largest fushing themselves furthest down. That of Bosshms at Chamomi, which comes from the highest part of Mont Banc, reaches a point 5500 feet below the snow-line, where it in embosomed amongst luxmriant wool, ani is almost in contact with corntiehls. Howker and others bave described the ylaciers of the Mimalaya. Iepland and spithergen alsu abound in glatiers. It is in such northern localities that the emts of the ghaciers. resting on the waters of the ocean, get broken off by transverse erevasses, and that away as icelergs.
It has alrealy been noticel that the former existence of glaciers is indicated hy the occurrence of moranes. These have been noticed in varims bocalities in Wales, England, and scotland. They are referred to the jeriod when the Boubler-Clay (q. r.) was deposited; and this, with the sands and gravels which are associatel with it, are sometimes included under the title Glatial Depmsits,

GLA'ClS (allied to glade in the sense of a lawo), in Fortification ( $\mathrm{q} . \mathrm{r}$. ), the slope of earth, nsually turfed, which inclines from the coverel-way towards the country. Its object is to bring assailants, as they approach, into a conspicums line of fire from the parapet of the fortress, and also to mask the general works of the place.

GLA'DIATOl:, in Antiquity, from gherlits, a sword, was one who fought in the arena, at the amphitheatre at Jimme, and in othor cities, for the amusement of the pullice. The gladiators were generally slaves, hungt and trained for the purpose, by masters who made this their business. The custom is supposed to have been horrowed from the East. and to have had its arigin in the practice of human sacrifices, or that of taking the lives of eaptives or prisoners of war, in honour of heroes who had dien in hattle. Thus, in the I/imP. we read that Achilles sacritieed twelve Trojan pirisoners to the manes of his friend latroclus, and Virgil speaks of captives sent to Evamler, to he sacriticed at the funeral of his son l'allas. The 'yreat eustom' of the king of Wahomey thas finds warrant in classic anticuity; and the North American ludians, in putting their prisoners to death with tortures, hase only retincl upon an ancient barbarism.

After a time, all considerable funerals were solemnised by human sacritices, which tomk the form of combats, in which, to increase the interest of the spectators, the prisoners were refuireal to sacritice each other: and as prisoners, and afterwards other slaves, were kept for this parpose, they were trained to fight with skill and courage, to make the spectacle more impressive. These contests thrst took place at funerals, but afterwards in the amphitheatre; aud in jrecess of time, instead of a funeral
rite, became a common amusment. The first we real of in Joman history was the slaw of a conntore of three jairs of ghablars, given hy Marens and Decius lirutus, on the insath oi their father, in the year of liome 4!\%. In the yor aria, a slow of twenty-two pairs was given in the Formm. In int the tirst Africanos doverted his army at New Car. thage with a ghational exhibition. 'The fashim now rapidly increased. Dagistrates, pulide offimers, rambliates for the phoular suffiages, mave shows to the people, which consisted chin+fly of these humb: and fenerally mortal enconters. The enprows excectell all others in the extent and magniticenere of these crubl sumetache. Julus 'asar gave a show
 will-heasts, and sea-fichts, for loo days; Trajan gave a show of 123 days, in which ofk men fought with and killed each other, or folloght with whll. beasts for the ammemmat of the 70,000 liomans. patricians aul phobians, the highest ladies and the lowest rahbur, assumberd in the Conesenm. A vast momber of sliwes from all parts of the world were kept in lomur, and trained for these whathions. There were so many at the time of Catiline's conspiraey, that they were thought dangerous to the public safety, ani it was promed to elistribute then among the distant garrismas.

Efforts wore male to hmit the number of glatiators, and diamish the frequency of these fhows "icero propusel a law, that no man should give one for two years hefore becoming a caulidate for office. The Emperor Augustus forrade more than two shows in a year, or that one shoukl be given by a man worth less than half a million sesterces; but it was diffienlt to restrain what hal heconve a prassion, and men even had such contesta for the amusement of their goests at ordinary fraste

These shows were announcel big sbow-bills and pictures, like the phays of our theates. The glaniators were trained and sworn to fight to the death. If they shewed cowardice, they were killed with tortures. They fought at first with wooden sworls, and then with steel. When one of the combatanta was disarmed, or upon the ground, the victor looked to the imperor, if present. or to the peonle, for the simal of death; if they raisen their thmons, his life was epared; if they turnel them down, he executed the fatal mandate. A gladiator who had conguered was rewarded with a hanch of palm, and sometimes with his fredom. Thung the ulatiators at tirst were slaves, freemen afterwarils enterel the profession, and even knights. Senators and knights funght in the shows of Nero, and women in those of Jomitian. The Emperor Constantine prohilnted the contests of gladiators, 32.5 A.1.; but they could not at once be abolishat. In the reigu of Honorius, Telemaclus went into the arema to stop the fight, when the prople stomal him. They were timally abolished by Theodoric, Joo A. D.

GLADI'OLUS, a genus of plants of the natural orier Jridere, with a tulular jerianth, the limb of which is divided into six muequal semments, threadlike, undividen stimmas, and wingod seeds. The routs are hullous; the leaves linearor sworl-shaped, whence the name (Lat. a little sword). The Cape of Grood Hope prolnces the grater number of the known spechs, as well as of several allied genera once incluted in this. A fow, howerer, are natives of other conntri-s, and two or thre are foum in Enroje. Sone are British. Minst of tha species have Howers of great beauty; and some of them are among the tinest ornaments of nur flower-borders and grem-homars. They are proparated either by seed or by offiset buths: ami in the former way many tine now varieties have leen froduced. Extraondinary medicinal virtues were fomprly ascribed
to the lull, of $G_{0}$ communis, one of the European sucies, finmed as far north as Frankfort-on-the-

(idadiolus Itanosus.
Oder. The Hottentuts eat the lullos of some of the species, which contain a considerable quantity of starch.

GLADSTONE, Tine Right Hox. Wintimy Ewhet, statesman amb crator, the third sim of Sir Jhhn Cilalstone, Burt., of Fisque, in Kineardineshire, was lom, 1509 , at Liverpool, where his father, originally of leith, harl wou eminence and wealth as a Weist India merchant. Ar tanming was a frequent guest at his father's homse when he risited his liverumbl constituents, and from the conversation of the ereat statesman, 6 . received impressions which gave a colour to his subseruent aims. He was sent to Eton, where he distincuished himself as a student, and afterwards entered himsulf of Chist Church, Oxford, where he closed a brilliant college eareer ly takine: a donhle first-class degree in 1831. He anteral the House of Commons in 1832 fin the Dake of Newcastle's borongh of Newark. He hed the post of Lond of the Treasury and afterwarls that of Under.secritary uf state for the Colonies in the Peel uovernment, fur a few months in $18.34-153.3$. In 18:5, he pmblished his first work, The Stute in its Reletions with the fhurch. which gave occasion to Mr Macanday to describe bim, in a coldhrated review of his work, as a 'youns man of mblemished character, the rising hope of those stern and moleming Tories' whe folluwed sir Fiobert Ped, while they abhorred his cautious temper and moderate onimions. In 1541, G. became Vice-President of the learl of Trade in the Teel administratiom, and in 184:3, president of the Boarl. Next to his chief, he tom the most prominent part in the revision of the tarm and reduction of iupurt daties, which reached their natural thelopment in the repal of the Com Laws. He resignel office in February 184.5, when Sir F . Feel pronsed to increase the enduwments of the College of Maynonth. a proposal at variance with all the principles laid dumin ly (a. in his work. ITe rejoined the mioistry in Decemlare 104. , succeeding the Earl of Derley (who refused to he a party to the repeal of the Corn Laws) as Colonial Secretary. He reallered Sir R. T'rel eloquent and effective ait in carrying the great measure of free trade throush the llmase of Commons. but paisl the penaly in the loiss buth of his rticee and his scat, for the then Duke of Neweasth, claiming to 'do whit he liked
with his own,' refusel to sanction his re-dection for Newark. In 18ta, he was elected 11.P. for the university of Oxforl, which he continued to remesent for einhtecn years. During a visit to Naples in 150, ho was induced ley curlosity to attend the trial ui M. Voprio, whe was scatenced to several years' imprismment, abl suhjeeted to indimities and cruelties which rumen the gencrons indignation of the buglish statesum. The dungenns of the kingdom of the Twichelines at this feriod swarmed with political prisoners, imal (i., in a letter to the Earl of Abremen, made all Europe ring with the story of their sutferings and their wrongs. He after that adrocated the canse of Italiar independence in many choquent spreches, In 153, he oppred the Leclesiastical Titles Bill, bronght in by Lord I. Tiussell, thimking that no legislation was necessary, and that the a.t sammed of religious persecution. After r-fusing an wher to hoh ithee lmder herl Derby, he became "hancellor of the Exchequer in the coalation tocermment formed by the Earl of Aberden in 18.0 . When that government fell hefore a motion in the Honse of Commens for inguring into the state of the army before sebastuph. G. contimed for a brief periol a member of the cabinet of Lord Palmerston, but soom retired. from an unwillingness to consent to the appointment of the selonstopol committee. (i. then went into opposition, and in 1857 made an eloguent and dimargir speech on Mr Colulen's motion condemnatory of Cir John Bowring's proceedings in China, which hrought about the defeat of Lord Palmerston, and the dissulntion of parliament. In 15.58. (i. accepted a special mission of importance to the lunian Islanls, In the same year, he pablished a work on Homer and the Homeric A!pe. In the secmal Palmerston alministration, he resmmel the post of chancellor of the Exchequer. In 1860, he carried throw parliament a commercial treaty with France, which, while it hastel, largely increased the trale between the two countrics. II is financial scheme that year involved among other promsals the alolition of the maper-duty, which was strongly lout unsuccessfully oprosed in the Hhase of Commons. In the Upper House, the l'aper-duty Repeal Bill was thrown out on financial gromils. it. holdy denounced this interference with the taxiny 1 rivileges of the Commens. In 1801, he incompated the repeal of the paperduty in the finmeral scheme of the year, and had the satisfaction of witnessing the removal of the last obstacle to the dissemimation of knowledge. Relatious with the Unversity constituency had now become so menacing, that in 1861 south Laveashire asked him to stand as a liheral candidate. This he retused at the time; lint, rejected by i majority of his acalemic eonstituency at the general election in 18G5, he was returned by South Lancashire third on the poll. In 1806, (t., now leater of the House of Commons-Lord Palmerston haviner died in Uctuber $38 b^{5}$-bronght in a lieform linh. the defeat of which caused Earl Russell to resign. At the general election in 156s, south-west Lancashire rejecterl, and Creenwich returnel him. Accoling to ofhee as First lord of the Treasury at the close of that year, (i., in 1500, disestaldisherl the Irish Chureh; in 10 oro, conducted to a successiul jssue his Irish Land bill, and the following year abolished, by the exercise of the royal premgative, purchase in the army. Another event of 1571 was the Washington Treaty respecting the Alabama clams. In:s more reecnt homs indmle a very lamlatory eritigue of

CLLDND are diviked by anatomists into two great classes, viz., true secretiog glands and ductless glames.

The first clans constitute special wrinus which are Westimed fur the probluetron of the ehaef sucetions; as, for example, the lachyzaal, mammary, and salivary ghanls, the liver, bincreas, lidmeys, de: while the sily rarenal eapsules, the spleen, the thymans, and the theromb bunis to the second dass.

An winary secreting

Fig. 1.-Lohtule of Parotil Crland of an Infant:
Filled whin moreury, and matriticd if diametors. "rlaml consists of an aneremation of follicles. all of which open into a common eluct, by which the ulamhular prothet is discharmal. The fulliches contam in their interion (etls (1).. ), wheln are the active agents in the secretiny mocess; while their exteridn is surrommend hy a net-work of capllaries, from whose cuntents the materials of secretan are extricted.

The simplest furm of a fland is the inversion of the surface of a secretimer membrane into follicles, which discharge their contents npen it by semarate months. Of this we Lave examples in the gastric glands and follicles of Lieherkuhn described and tumed in the article Dagencros. Dr Carpenter very well exhibits the commencement of the proydessive emmplication which is olsorved in must of the slandulu structures focmraing in man and the higher anmads in the accompanying diagram (lig. 2 ), where \& rupesents a

 than the eramis of reetedarate anmals; and the jorms, in all of which a large ammunt of serveting sumfer is pupantol in mompartively little space, are witen sery eracuful. In the aceompanyine cronk (fis. : I), the firet two ropresent ditherent forms of salivary glanis, the thimi is a reprodmetive gland,
while the fonrth and lifth are glands yielding the atrid matter which some insects sccrete.

Fig. 3.
1, part of the salivary gland of Nepa Cincrea \{after Ramdohr): 2 , salivary vesel of Cicada Oimi (after Succow); 3, testen of staphylinus Maxillorus; 4, secreting gland of Chlanius Velutimus; 5, seereting gland of Calathus Fulvipes.

To understand the structure of a complex gland like the liver or kilney, it must be followed from the simplest form in which it is known to oceur through its various degrees of eomplication. In this way the liver may le traced, from the lowest mollusea (where it exists as simple follieles, lodged in the walls of the stomach, and puring their product into its cavity ly separate orifices) nip to man, in whom it is an organ of extrme intrieaey; and similarly in the early intal state of the higher animals, the liver and other secreting organs more or less resemble

Fíg. 4.-Mammary Gland of Ornithorhynchus.
the persistent state of those parts in animals lower in the ammal seale. In the same way, the Mammary filand ( $q . \cdots$ ) which is a structure of considerable complexity in the ligher mammals, presents a very simple arrangement in the lowest type of this class, the omithorlyneches, being merely a cunster of cecal follicles. each of which discharges its eontents ly its aun orifice.
sometimes a cland has several ducts (as, for example, the lachrymal gland, lut, as a general rule, the most important glamis have only a single emal, formed ly the mion of the individual ducts, which convers away the pruluct of the secreting action of the whole mass.

Whatever be the complexity in the general arrangement of the elements of a gland in the higher anmals, these elements are always fond ta resolve themstues into fillicles or tubuili, which cacluse the trne seercting cells.
The sccond class of glands resemble the seereting slands in exterval conformation, and in the possession of a solid farenchymatous tissue, hut differ from them in the absence of a duct ar opening for the remuval of the prolucts of secretion; andindeed,
except in the case of the thymus, no material resembling a secented product is yielded by any of them. In all of them, the tissue mainly consists of cells and nuclei, with a great ahondance of blombvessels. They may prohably he remarded as appendares to the vascular system; and from the absence of any excretory duct, they have receisal the name of rescular ductless glenats.

The Lymqutute cildents holong to a difterent class of stristures, aud will be desernbed in the article on the Lismphatic Sysmen.

GLANDS, Diseases of. The lymphatie ghams are subject to enlargement from aente intlammation and abscess, usually in consequence of irritation of the part from which their lymplaties spring, as in the case of scarlet fever, in which the glimels of the throat are affectel; in gouorrhea, the glames of the groin, \&e. The treatment of suchabseesses belomes to the orlinary primeiples oi suruery. See Abscass. A much more tronldesome affection of the glands is the slow, comparatively painless, at first dense solicl swelling which they mideren in arofna (q. v.), which tenls very slowly, if at all, to simpuration, ami sometimes remains for years. In Syphitis ( $\mathrm{H}_{1}$. v.) and Cancer ( $q$. v.), there are also enlargements of the lymphatic glands. Scrofulous or tuberenlar alisease of the mesenteric glanls in chillren constitutes Tabes mesenterica (if. v.). The lareer glames, as the Liver, Kidney, Pancreas, Spleen, Thytoid, Thyuns, Tusticle, and even the Pituitary Glamd, have all their special discases, which will be noticed, so far as uecessary, in treating of these organs.

GLANVILLE. The earliest treatise on the laws of England, Troctatus de Leqithas it Comsutudinibus Anelie, is written by Glanvile. of this work, I'rofessor Robertson says (Mist. of Charles 1\%), that it is supposed to have been the first undertaking of the kind in any comery in Europe It was composed about 11s1. The anthor is promally suppsed to have been Ranulphus de G., chief-justice in the reign of Henry L1. Nir Mathew Hale, while he admits the date of the work to have been in the reign of that monarelh, appears to hesitate to ascribe the authorship to the chicf-justice Lorl Camplad (Lives of the Chif Justices, i. 2.5) remarks that (i., in some points, is still of anthority, 'and may be perused wath alrantage ly all who take ais interest in our legal antiquities. This author is to be considered the father of English jurispmence. Bracton, who writes in the following century, is more methorlical, but he itraws larsely from the Roman civil law, and is ofter rather speculative: while Cilansilie actually details to us the practice of the Aula Rexis in which be presided, furnishes us with a coppous suplly of precedents of writs and other procedure then in use, and explains with mnch precision the distinction and subtilties of the system which, in the tifth Norman reign, had nearly superseded the simple juridical institutions of our A aflosaxon ancestors. This work was first printed in the year 1554, at the mstanee of Sir W. Stanfurl, a judge of the Common Pleas. The treatise of $G$. elosely resembles the swatish Digano Majestatem ( 1.6 .1 ). 'The latter,' says Coke (Inst. is. 345), 'doth in sulstance agree with our Glanville, and most commonly te rerto in pertum, and many tines our Glanville is cited therein by speeial name.' A dispute has arisen, in consequence of this close simularity, as to which comery shall claim the hononr of producing the origimal work. Mr Erskine thes not hesitate to claim the distinction for Scotland: but Lord Stair, fullowing the opinion of Craig, frankly admits "that those buks, callod Regiem M, jestatem, are no part of our law, bat were comand for the customs of Englami, in thirteen borks,
by the Earl of Chestir, and by sorue muknown aml ineonsiletate hand stohtu thence, and resaremate in those four books which pass amonget ms ' (otair, i. 1. з. 16).

GLA'RUS, a canton in the morth-east of Switzerland, is triangular in shape, and is loumded on the N.-E. hy the canton of sit (iall, on the S.E. liy that of the Grisons, and on the W. ly those of Shwytz and C'ri. It has an area of 062 square
 tiss were Catholics, the whers almont all Calvinists. The surface is mountainous, the himest peak being that of Toubibery or Dodibers in the smathwest, wheh reaches a huchat of 11 ,isco fret. From the font of this momatain, the linth, the chirf river, thows north-moth-east, throngh the midnle of the canton, amblemptics itself into the lake of Wallenstadt. The mindind salleys, after that of the Liuth, are the Sernthal and the lilenthal, both fomed by trihutaries of the limth. The climate is wry severe, amb only une-tith of the lanl is arable. This cantom, in which the rearine of eattle was formerly the main parsuit of the inhabitants, is nosw an impurtant mandacturing distriet. The pincipal manufactures are cottun, Mondlen, muslin, and silk Grouts, amb pres and slates. Creat part of tho manufactures are experted to the East, to North Africa, America, and Chana. The green cheeso calloul Schaloziger, whith is wholly manle hore, and other agricultural promets, are exported. In nono of the swiss cantoms dues the popation so slowly increase as in that of cilarus. The old homely mamers, and many eren of the customs of antquity, still presail among the perples. In the carliest times, (r. was reckined souctimes as a part of thotia, som times as a part of Swalia, and was peopled by German settlers. After various chatioes. it passed intu the possession of the Dukes of Anstria, but ultimately senter its indenemence ly the victories of Nifols in 1332 and $1: 38$, when it joined the Swiss confederation. The chite town is ilarus, with a large finthic churdh, which serves bith for Catholics aml I'rotestants and in which Zuingli was parson from late to 1516 . Pop. 40 s ..

GLA'SGOW, the industrial metronemis of Sootland, is, aftor Lundon, one of the largest and most important caties in the kingum. It is situated on the Clyde, in the loswer ward of Lanarkshire, aml weupiss chielly the north sube of the river, bat has large and populous sulurbs on the sonth side. The river is crossed ly three stome lringes, two uf which are of granite, measuring bil feet in brealth over the parapets, and much almined for their light amb graceful arehitecture, and by two suspension-bidenes for fuot-passengers, each of a single span. Below the bridges, there are ferry-lwats diving at all hours.

The groum upon which $G$. is built is, for the most fart, level, lout in the north and north-west distriets, there are consiblemble clevations. Owing to the number of cotton-factories, chemical werks, fommbies, and work-shops of all kimes, the eity has a somewhat ding aud sunky aspect; while many of the streets are contimally thronged with rassengers, anl noisy with carts, calds, amb ommliuses. In other respects, it las many attractions. The houses facing the river stant well back, leaving spacions thoroughfares on each side, and affording full and noble views of the bridges, of several handsume street races and poblic buhlings, ann of the harbour with its steaming fumnels and forests of marts. Nost of the leading streets run from east to west, paralie? with the river, and almost all the streets, except in the oldest parts of the city, are laid of in straicht lines. The houses are generally loity, and built of freestone, the thors of each

## GLASGOW

tenement being usually necupied by separate families, entering by a common stair. In the fashionable quarters, what are called 'self-contained' houses prevail. A. has comparatively few squares or other open spaces: but it has three public parks-two of them of great extent, and the third of great beauty-namely, the Green ( 140 acres), oechpying the level next the Clyde at the east end; Queen's lark (upwards of 100 acres), finely sitnated on a rising-gromd to the south; and Kelvingrove ( 10 aeres), rounding the face of a hill crowned with noble terraces, and sloping down to the Kelvin, at the west end. The eity is ahout three miles in length from east to west, and is about eicht miles in circumference.
(8. had its first muclens in the eatheiral, and afterwards in the university. The former is situated in the north-east of the city on a height on the banks of the Molendinar stream, which runs between the old burying-ground and a stee, rocky eminence formerly known as the Fir Park, hut now transformed into the Necropolis, a modern cemetery, studded and crowned with monuments. It is from this ravine that the name ( i . is sulp posed to have heen derived, etymologists professing to tind in it two Celtic worls signifying a ' Wark (ilen.' St lientigern. or St Mimgo, founded a bishopric on the banks of the Molendinar about 560: lont for more than five hundred years afterwards, the history of the place is a hlank. About the year 1115, Bavid, prince of Cumbria (afterwards king of Scotland), restored the see, and nupinted his Ireceptor, John, to the bishopric, who laid the fundations of a cathedral, which was replaced by the present pile, founded by Bishop Jocelin in 1181. In 1190, King Wilbam the Lion erected $G$. into a burgh, with the privilege of an annual fair ; but for a century and a half later, it contimued an insignificant town of not more than 1.500 inhabitants. In 3345 , Bishop Rae mailt the first stone loringe across the Clyde; and in 1451, Bishor Turnbull estahlished the university, havina obtained a bull for that gupose from Pope Nicholas V. The latter event gave a considerable impetus to the place; yet, in 1556 , G. only rankel eleventh in importance among the towns of Scotland.

The city as it now exists is almost wholly molern, having quintuled in dimensions during the last 60 years. This immense growth has arisen from its situation in the midst of a district abounding in coal and iron, and from the facilities aflorded by tho (Tyde for the cultivation of a worl-wide commerce. At the same time, it must be almitted that much of its prosucrity is due to local ingenrity and enterprise. It was here that James Watt, in 1765, mate his memorable improvement on the steamengine; it was here that Henry Bell, in 1812, first (in the old world) demonstrated the practicahility of steam-narigation. An enormous snm has been expuded on the widening and deepening of the river, now nariqable by vessels ano feet long, and drawing 23 feet of water. The harbour of Port-Dundas, on the Forth and Clyde Camal, situated on the high grome north of the city, has likewise afforded facilitics to its commerce. The enterprising spirit of the inhahitants hegan to manifest itself during the 17 th century. Sugar-refining, the distillation of spirits from molasses, and the manufacture of son 1 , were among their earlier industries. The prening up of the American colonies to Sentel enterprise after the Union gave an inmense increase to its commerce. G. became the chief emprimm of the tobaceo trale, and its Virginian mereliants formed a local aristocracy, remarkable for wealth and houteur: '1 his trade was at length paralysed by the American war: hut sugar cultivation in the W゙est Indies,
and the introduction of the cotton manufacture, openel up new paths to oplence. Colico-printing, turkey-red dyeing, beer-brewing, ant other branches followed; and with the rapid expansion of the iron trade. inchuling machine-making and steamboat lmilding, the eity has attainel its present magnitude. Among its thousand chimney-stalks, there is one of 400 and one of 450 feet, being the highest in the British dominions. The latter carries alnit the noxious vapous of st Follox, the largest chemical works in the worle, covering 12 aeres of gromnd, and employing upwards of 1000 men.

In all that relates to lighting, paving, sewerage, and the like, $G$. deserves laulatory mention. The eity is governed by a lord provost, 10 bailies, and 45 councillors, to whom are added the dean of guild from the Merchants', and the deacon-eonvener from the 'Trales' House. The sheriff and four slieriffsubstitutes exercise within the eity a co-orimate jurisdiction with the magistrates, and preside over various civil and criminal courts. Much of the spirit which characterises the manufacturing and commercial affairs of $G$. has been earried into its municijal arrangements. Corporation halls, comprising a valuable gallery of mantings, have been secured for the eitizens; public parks have been purchased at great cost, and laid out in a style of unsurpassecl beanty; and a supply of water has been introduced from Loch Katrine at the bountiful rate of $32,003.000$ gallons a chay. G. has 54,469 registered voters, and sends three members to parliament.

Jany of the public huidings deserve notice. The cathedral, which has lately been restored, and the windows euriched with stained glass, chietly from Mlunich, is one of the finest First Pointed churehes in the kinglom. The Royal Exchange, in Queen Street, several of the banks, and many of the ehurehes, likewise present fine specimens of architecture in a variety of styles. Gr. has three equestrian statues, one of William 1II. at the Cross, another of the Duke of Wellinoton in front of the Royal Exchange, and the third of Queen Victoria in St Vineent Place. The last two are by Marochetti. In the Green there is an obelisk, $14 t$ feet high, to Nelson, forming a conspicuons oljeet in the landscape. This tall structure, which stands quite alone, has been twice struck by lightning, once in 1810, and again in 1861. In George's Square there are a column surmounted by a statue of Sir Walter Scott; a fine statue of Sir John Noore by Flaxman; a statue of James Watt, in a sitting posture, by Chantrey; and a statue of Sir Robert Peel, by John Mossman. A marble statue of Pitt, by Flaxman, has lately been removed from the old town-hall at the Cross to the new Corporation Galleries, Sauchichall Street. Charitable institutions and benevolent societies abound; and zealous and suceessfnl efforts have lately been made to provide cheap, and imocent amusements for the working-classes. There are two theatres, three maseums, and numerous lialls in which soirées and concerts are hedd almost nightly during winter. The wealthier inhabitants migrate to the coast in shoals during the summer, and cheap Saturday excusions by river and rail are extensively taken advantage of by the working-classes. To the north-west of the city is a botanic garden of abont 40 aeres, which is thrown open every summer, during the fair holidays, at a merely nominal charge. With the additional and recent attraction of the Kiblle Conservatory, large numbers visit these gardens. Besides the Necropolis, there are several other garden cemeteries in the vicinity, of which Sighthill, occupying a northern elevation, is the most picturesque.
G. has four laidy, and upwarls of a dozen weekly newspapers. It has above 250 churehes and chapels, viz.: Established Church, 60; Free Churd, 57 ; United Presbyterian, 48; Roman Catholic, 13 ; Indepemdent, 15 ; Baptist, 9 ; Episcopaliam, 9 ; leformed lresbyterian, 5 ; uthers, above 34 . In 1801, the bopulation was 83.769 ; in 1 sis1, it amonutet to 446,635 ; in 1571 , it reached 47,310 ; and includin: the suburbs, 5ibic, 150 .

GLaseow, The Usivfesity of, was foumbed in 1451 by Bishop Tumball, whas procured a bull of ratification from Pope Nicholas Y. In 1460 , James, first Lord Hamilton, endowed a college on the site-in the densest part of the lligh Street -of the late builaings, the older portions of which were erected between 1632 and 1650 . Queen Mary bestowed on the miversity 13 acres of aljacent ground. Ia 1577, James V1. sranted increased funds in a new charter. In 1804 , the university buildings and auljacent lands were sold. and handsome new buikings, designad ly Sir (f. Gillert Scott of London, were erected on the western hank of the Kelvin, overlooking the West Lind l'irk, which were formally epened in 1570. The cust of the bulding, when complete, will be A3M0,000; of which $£ 150,000$ have becn subscribed in Glaser ow and elsewhere, Parliament having promised $\mathfrak{d l} \mathbf{G}, 000$.

Chuirs, Office-bearers, Degrees.--The office-hearers of the university consist of Chancellor, Reetor, Principal, and Iean of Faculties. The Chanculor, holds his office for life, and up to the present time has leen elected by the senate: but the next, and all future tlections, will take phace by the umiversity council, as in Elinhurgh University; the Rector is elected triennially ly the matriculated students, who are divided, according to their place of birth, into four nations-Glottiana (Lanarkshire), Trensforthana. (Sentlant north of the Forth), Rothseiana (Buteshire, Fenfrewshire, and Ayrshire), Londoniona (all other places). The Dean of Faculties is elected anmually by the senate. The duties of Chancellor and lector are chiclly honorary. The chairs are Latin, Greek, Mathematies, Larie, Natural Pbilosophy, Meral Philosephy, English Language and Literature, Anatomy, ]'hysiology, Materia Merlica, Practice of l'hysic, Matural 1listory, 'hemistry', Clinical Surgery and Medicme, Milwifery, Butany, Surgery, Oriental Languages, Divinity. Church History, Biblical Criticism, Civil law, Conveyancing, Civil Engineering, and l'ractical Astronemy: The degrees granted are Master of Arts, Doctor of Medicine, Master of Surgery, Bachelor of Divinity, Docter of Divinity, Doctor of Laws, and Bacbelor of Laws, the last three being lonorary desrees. The ceremeny of graduation was of old conducted with no little pemp through all its stages, from its begiming in what was called the Black stone Examination,' to its close in the act of 'Laureation' in the Cellege Hall, or one of the city churches. The number of matriculated studenta now averages about 1200; they reside outsite the college wails; and these in attendance on classes in the Faculty of Arts wear searlet gowns.

Bursaries and E.chititions.-The Senatirs Academicus has in its gift about 30 bursaries, and the funds attached to several of these are applicable to from fone to six students: their yearly yahues range from $£ 6$ to 250 , and some may be held for a perind of four years. The Oxford Ertibition.-In 1677. John Snell, a native of Ayrshire, afterwards of UFeten in Warwickshire, presented the university with an endowment, consisting of a landel estate, for the purpese of supporting at Balliol College, Oxferd, ten students who hail previously studied at Glasgew. The property was let in 1809 on a lease of 21 years, at an annul rental of $£ 1500$,
and the ten exhibitioners received $£ 133$, Gs. Sd. per anmun each.

Libraries, Musenms, in. - The library was founded prior to the Reformation, and now contains about $10 \overline{,}, 000$ voluntes. It is supported by an aunual grant of dou from the Treasury, graduation fees, the contributions of stulents, \&ec. subsiliary libraries are attached to several of the elasses, the lowks being selected with a view to the sulpjects treated of in ench class. In July 1781, the celebrated Dr William Hunter. of lommon framed a will, leaviay to the principal and professors of the university his splendid collection of coins, medals, and anatomical preparations; and for the aceommodation and conservation of these, a building was erected in 1804, lut they are now located in tho new university. The university alse posisusses an observatory and a botanical garden, and several of the professors have collections of apmaratus attached to their classes, illustrative of the courses delivered.

Eminent Profssors end Students.-A Aneng the men of eminence who lave taught or studied in the university, are Bishop William Elphinstome, John Major, John Sottiswonle, Adilrew Melville, Jumes Melville, linbert loyd of Truchria, John Canorn, Zachary boyd. Fuhtert Baillie: Jinnes Dalrymple, first Viseount of stair: (iilbert Lumet, bshop of Salishury : Dr John Donglas, hishop of Nalishury; Dr kolert Simsun, Francis Huteheson, Dr William lfunter, Dr James lloor, Ir Adam Sinith. Dr Thomas lieid, lor William Cullen, Dr Joseph Black, Dr Matthew Baillie, I'rofessor John Miller, 'Thomas Thomson, Francis Jeffrey, John (iibson Lockbart, sir Willian Ilamilton, the present Arehbishop of C'anterbury.

GLASS, from the Fr. glace (Lat. glacies), ice, which it resembles in its transparency. Glass is essentially a combination of silica with some alkali or alkaline earth, such as lime, barytes, \&e. Generally speaking, it is umlerstom to be a silicate of selli, or a combination of silica or flint with one ar more of the salts of sodium, with the atdition, for some purpuses, of certain metallic oxides and other substanets.
Mistory--The invention of glass dates from the earhest antiquity, and the honour of its diseovery has been contested by several nations. As the oldest knewn specimens are Egyptian, its invention may with great probalility be attributed to that people. It is mentioned as early as the 5 th or 6th dynasty, and called bashmu, the Contie bijni: and articles made of it are represented in the tombs of the period; while its fabrieation is depieted in sepulehres of the 10th dynasty -i. e., about 1800 b. c. The glass of Epypit was generally opaque, rarely transparent, and always coloured, the articles made of it being of small size, and principally for atornment, as beads, vases, small figures, and olijects for inlaying into weod or other material. Specimens exist of this glass hearing the name of the queen Hatasu of the 1Sth dynasty, 144.5 B. c., and vases of blue glass, with wary lines in white, light-Mue, yellow, back, red, and green, of that and a later age, have leen discoverel. The Eyyptians also successfully imitated precious and other stones in glass-as emeralls, lajis lazuli, turquoises, jaspers, onyx, and obsidian; for this prorpose, they used nearly the same materials as at present, employing manganese, conper, iron, cobalt, gold, and tin. Transparent glass, indeed, does not appear earlier in Egypt than the efoth dynastr, about 750 в. c., when bottles and a few other objects-as figures for inlaying, and beads imitating gems-were mate of it. Accerling to lferodotus, the Ethiopians, two centuries later, placed their mummies in glass

## GLASS

coflins; lint the fact lans never been proved lyy any th yet discoverel.

Comer the native lharadas, Eerfitian glass seeme to have been extensively exported to direce and Italy, and its remitation still contimed monder the I'tolemins, when the furnaces of Alexandria problued glass vases of numburless shipes ami rmmiderable size. At this periml, the Eifyptians invented the millemori glass, emsisting of small threds of ghas aranem vertically and then fused, so that the whole rod thus fumed was of one pattern; and hy eutting ofl slices, each piece roproluced the same pattem. The glass heads of mentrepore thass, which are fonm in the tombs of Grece and Italy, and are formed by placing sliees of such rols in a mould and fusing the whole, are probally of Eiryptian or lhemician origin. Erypt still retaned the pre-minenee in the manafacture of glass under the Romans, the sand of Alexanditia heme indispensable for the finest pualities, and it exported glass to limme. Murian, on his visit. was struck with the activity of the manuarture, and sent to his friem, the Consul Servianus, one of the sases, called allosontes, or 'opaleseent:' and the Limnan writers mention with admination the melting, turning, and engraving of Esyptian glass. To the most tlonrishing perion of the empire are to be referred certain rases and slabs with white camei igures of fine execution in relief on a bhe backgronul, aml plates of opaque ghass for inlayiog the walls of moms, such as those which are said to have decoratel the mansion of the usurper Firmus. The art of glass-making, in fact, has never beome extinct in Edypt, the l'atimite Califs haring issued glass coins in the loth and llth eenturies, and beatiful lampo of glass enamelled on the surface with various choners having leen made in the 14 th century: Although the art of glass-making has frllen to the lowest eblo in Eoynt, the workmen are said to manifest considerable aqtitude in its prodinction.

After the Egrptians, the people of antiquity most renowned for glass were the lhomicians, whin were the lugendary inventors. Cortan of their mrechants, it is said, returning in a ship laden with natron or soda, and haviug been compelled ly stormy weather to land on a sandy tract noder Momen Carmel, placed their conkinr-pots on hamps of matron on the sam, which, fused by the heat of the fire, formed the first ghass. Silon, indeed, was long eelohrated for her ghas-wares made of the sand brought down from Mount Carmel to the mouth of the river Belus. The nature, however, of the earliest Phomieian glass is mbuown, unless the oragne little vases of the toilet foum in the tomis of Greece and italy, and the heads of the same discovered in the harrows and tumuli of the Whl Celtie and Tentonie tribes, were imports of the l'benieims. The vases of silon were, however, highly estemel at Rome under the Antonines, fragments of howls of hlue and amber glass, with the names of the Sidonian glass-makers, Artas and Irenens, stamped in Latin and Greek, having been foum in the ruins. Perhaps the Assyrian glass vases were made at Silon; at all events, the earliest dated specimen of transparent white glass is the vase having upon it stamped or engraved in Assyrian enneiform a lion and the name of Sargon, who reigned $722 \mathrm{~B} . \mathrm{c}$., found at Nimrad by Mr Layari ; and glass seems to have been imported or even made in Assyria as late as the time of the l'arthians, when Ninevel beeame the Roman colouy of Claudiopolis. Under the Sassanides, moulded class vessels, chaborately decorated, were made, as is shewn hy the cup of Chosroes, $531-579$ A. D., in the Louvre; and Persia eontinued to mann-
facture glass vessels in the Midule Ages. The Arahs seem to have derival their glass from the liyantines, and specimens introlaced into Lurope

Fig. 1.-Glass V'ise, bearing the name of Sargon, from Nimund.

Hy the Crusaders were ealled in royal aml other inventories Damascus glass: this wis coloured, and not phain. Although the art of glass-making appears to have been pretised in remote times, this nation does not appear to have attained any proficiency in it, and is content at the present day to re-melt Luropean glass; while some of its highest effurts do not exceed the imitation of jade. and other stones. There is still an extensive use of glass-lyads in the East, which are chictly mate at Khalib or Hebron. cilass was equally maknown to the llindus, except the profuction of a few trinkets and inferior oljects, till tho settlement of Eluropeans in Inlia; and the country was, at the remotest period, sumplied by Phenician, and, on the Minhe Agres, by the Venctian triulers. Although Josejhus clams the imention of the art for the Jews, no remains of Jewish glass are known, and it is probable that the dews were prineipally indebted for their supplies to the neighboumg cities of Tyre and sidon. Even in Greece itself, glass was ly no means ancient. In the days of Homer it was moknown. Herodotus, indeal, mentions its employment for ear-rings. but these may hase been of Plomieian fabric. It was called hyratos, crystal or iee, and lithos chyste, or fusible stone. Aristophanes, 450 B.c., mentions glass or erystal vessels, and various inscriptions contirm its use, but its value was next to goll, which cond hardly have been the ease if it had been of native mannfacture. In the 4th e. e.c., I'ausias, a celebrated painter, had depieted Mothe, or 'Intoxication,' drinking from a transparent glass bowl which revealed ber face. Glasses and inates, amphore and dintie large twohandled jars, were made of it, and also false stones for finger-rings, ealles sphuagides hyalenai. These last, ealled by archealogists pastes, were imitations of engraved stones in coloured glasses, usel for the rings of the poorer classes, and were no doubt often eoplies or impressions of engraved stones of celebrated masters; false gems and camei baving a subject in oparue white, sometimes like the sardonyx, with a brown layer superposed on the parts representing the hair, and the whole laid on a dark-blue ground, appear before the Christian era. Lenses were also made of glass, and the celestial sphere of Arehimetes was made of the same material. The supposed Phonieian coloured glass vases for the toilet, fonnd in the oldest sepulehres of Greece, it must he observed, have Greek shapes. Glass-makers, hyalopsoi. hyalepse, are also mentioned

## GLASS.

at a later period, when there can he no dombt the art was practised. Of the Alexambrian glass, uncotion has been alreaty mate; ant the loily of Alexander the Great was shewn to Alugustus in a glass cotin.

The glass-making art in italy does not date carlier than the commencenant of the loman Empire. importations from Nilon anil Alxamuria Having previously supplied the want of natise mamfacture: but there is ample evilence of its extensive manm. facture at that priod havinis heen introlnetd in the days of the 1 tolemies, large plates being uscal for merusting chanbers, veitrere equerep: and Irallow cohmus, maile of this material, with lamps insid". were used to illumme the puhlic theatres. As early as $\overline{5} 5 \mathrm{~s}, \mathrm{c}$., the theatre of scaurus had leen decorated with mirrors or flass platus. disposed on the walls. Glass was also nsed ior parimer. and fox the blae and green tessere of inosaics (see Mosart). Window-glass does not aprear till about the Bl C. A. B , the houses at 1 lerenlanmm, destroyed in the reign of 'litus, being glazed with talc, and some doult remaining as to the use of glass for this purpose at Lompeii. Lactantius in the 30 c. A. H. : St Jerome, 40. A. 5 , mention glass windows. Ohder windows of this material are said to have heen found at Ficulbea, and even in Lomlon. U'uder the liomans, coloured as well as

## GLASS.

The entrance to the main furmace, throngh which the puts have been monducen, is then elased with a mosable done of tirebrick, and covered over with fireclay, to prevent the ascape of heat; the pots in the formace are filled with the proped waterials for glase, now ealled frit, mixed with about a sixth or ci hath part of cullet or bowen wass: the rpenings are chased temporarily fur two or thece hours, by which time the first charge of material has melted down, laring room for a further supply, which is then thrown into the fot, and this is repaterl two or three times until the bent is completely full. The openimgs are then clused, and the heat increasel to the utmast for ten or twelve hours: this purt of the operation is called foumbing, nud the result of it is to furfectly mult and vitrify the materials. The heat of the furnace is now somewhat relncel, and the seum is removed from the surface of the melterl material, now technically ealked metal, by a workman ealled the skimmer, whose labonr requires great care and much experience, as the metal is at a glowing white heat, aud is only with difticulty distingushatbe in the fierce white glare of the furnace the netal is now ready for the commencoment of the jownen, as the pperation of working it $u$, is callect. This term, like most others in the glass trade, is derived from the French.

The arraggements so far aplly equally to all kinds of glass. We now, however, return to the manfacture of glass bottles, iu order the more fully to understand which, we give the following grommiplan of one of the houses in which this is carried on (fig. S). $\quad u$ is the main furnace, which in this case

Fig. S.
is square, and male to hold nuly four pots: at ench corner is an openine, which allows the fire to ontur four small reverberithry fumaces, $b, b, b, b$, ealled arches: two are called the comerse arches, and the others the fine arches. In the two former, the somp) makers' waste is calcined at a red heat for at least four hours, or whilst a set of pots is being worked out-that is to say, one jonney. Then the calcined matorial is gromed amb sifted in the grinding ame siftins house, b, after which it is mingled with the samp. \&e., and transferred to the fine arches, where for the term of auther joumey it is arain calcined. At the end of that time, the pots being empty, are retilled with this material.

When the furnaces are onened for a jouney, the skimuner first remures the scom, and manies the
way clear for the blower and moulder, who takes his llow-pipe of iron, six feet in length, the part hed in the hand being guarded liy a covering of wool and wher non-combeting materials. After heating the empl of the blow-pipe in the furnace month, he dips it into the pot, and turning it romm, gathers as mul metal on the end as is sutionint to form a bottle of the size required. Usually, in bottle making, one gathering suffices, but in larger operations, such as lowing windowglass, more gatheringes have to le mate. Tho operator then hows fently down the pipe, and havins thas slightly distemed the bulb of red hot plastic glass (dig. 11, a), he takes it to a plato of polished iron, forming a low bench ealled the muter, or mocering tolde. On this he turns it romol, moulding the romed lump of glass into a conical form, the change being represented in fis. 11, $b$. This opration, eallet matering, is performed in all cases whre glass is blown; and as it is necessary that the glass should be pretty tirm before mavering, it is oiten cooled by sprinkling with water, aml even, as in the ease of window-glass and other large blowings, tornines it in a cavity eontaining water, which is made by hollowing out a block of wood, nsually, if attainalle, that of the pear-tree, which is said to be best for the purpose.

After being mavered, the glass is held to the mouth of the furance, and the operator blows down his blow-pipe, aul further distends his glass. Formerly, he commenced monlding it iato the form of a bottle with his shears, one arm of which was of charred woon, and the concase bottom was made by pushing a little piece of glass, called a punty, at the end of an iron rod ealled the pointel; the blowpipe was then detached by a slight how of the shears, and the pratly formed bottle was left at the end of the pointel attached by the puaty in the hands of a boy who attends upon the man, and hrought and applied the phaty: The man then took the pointel in one hani, and after softeuing the bottle in the mouth of the furnace, mondad the neck loy means of his shears, regulating the size of the opening lyy means of a small brass mould, the size and shape of a eork, attached to the middle of the shears; beating the neek again, he furmed with a small portion of metal from the pot the ring round the mouth of tho bottle. Now, however, after mavering, and the first slight howing, the operator inserts the glass into an iron or hrass moult, which is formod in two pieces, mening or closing ly the pressue of the foot on a lever. When the nond is closel, he hows down the pipe, and the bottle is completed all but the noek, the ring of which has to lee formed by the andition of a fresh piece of metal, as before des. cribed. Py this process, bottles are made with womlerful rapidity and exactness. At this stage of the mannfacture, ly either process, the lootles are taken from the workman by a little boy, who inserts the prongs of a fork into the necks, and earries them to one of the annealing arches, $l, d, d, d, d, d$, where they are carefully arranged in proper bins until the areh, which usually holds 144 lowen, is full; it is then closed, aud the heat is raser nearly to molting pint, and then allowed gradually to subside until it hecomes eold, whem the bottles are removed to make room for a fresh charge. In the phon, tis. $S$, e and $f$ are the sand and alkali stores; ato are stores for the prepared frit: and $i, j$, are sifting-cribs in the sifting-house.

Irimburglesis, whether crown or sheet, is made of much more carcfully selectel materials. They are slichtly ravied ly different manufacturers, but the following are the ingredients used in one of tho

## GLASS.

largest glass-louses in (ireat liritain: Siml (well dried), from the neighbourhool of Laighton Buzo zare, in Lediondshire; sulphate of sonda, ground; subearbonate of sola, white axile of arsenic, manganese, Welsh anthracite, chalk: limestone from Hopton Wood, Derbyshire; mitrate of sodia; cullot. ahout as much as is equal to an eighth part of the other ingretients. The exact pripurtions are only known to the mamfacturers. Finch iugredient is carefully powlerel lefore mixing, and they are afterwards ealcincel or frittel, except the anthracite, which is ableal in the pot for the purpose of decomposing the sulphate of soda, and dissipating its acid; and the manganese and arsenic, which are only abled in very small guantities, to improve the colour: too moch, however, of ead is sure to injure the glass, and thewere these materials can only be siffely used by experienced manipulators. The bulk of the glass, lowever, consists of the sand, and earionate and sulphate of soda.
The arrangement of the winlow-glass houses is different, and on a much larger seale than in the honses for huttle-glass, and exceptins in gatherinn and mavering, all the "perations subsequent to the foundmg are different. Fig. 9 will gre a gencral

phan of the honse for crown wimbow glass, and fig. 10 gives an eleration of one side of the main furnmee, with the three openings through which the glass is yathered from the pots. In tipe 9, $a$ is the main furnace; $b, b$, two tlashing furnaces; the projectint piece of brick-work, $l$, hoing the screen which protects the workman from the fire; and $c, c$ are two annealing inrnaces or orens.
When the finuling or meltint and the skimming are completed, the workman takes his blow-pin", whieh is alnout seren feet in lensth, heats it at the end, and dipuing it into the put of melted glass

Fig. 10.
or metrol through the opening (a., fies. 10), he gathers, ly a slight turn or two a quantity of glass, alout a pound and a half in weight; this be withdraws,
and after turning it alont for a minnte or two in the air until suticiently cosolecl, he then dips it in again, and over the first he makes a secomb gathering, which increases the weight to about three pounds weight; the same coudhin process is repeaten, and a thiril gathering is male, which lrings up the weight to alont nine fonuls; he then ludids his how-pine perpeudicularly with then glass downward, so that it may by its cavo weight mull downward from the fipe in the fonm of a symmetrical near-shaped lullt; , he next takes it t", the halowed bock beiore mentinned, and turns it romel in the water flaced in the carity by which it is male realy fur the mavering table. The workman, hy skifit manaswnent, nmersa the bull of glass into the form b, tix 11, and then forms a little know at its apex, liy turning it on a tixel har of iron ealleat the bullion thre; he then commences howing and som the bulb oi nearly sulid phas is expanited into a lares hollow sphere (c, fit. 11), still, howerur. with the little niphle made he the bultinu bar. A little boy now comes forward with an iron rul, the prointel, urnom the end of which has been gathered a suall lumpl of metal, called the funty. almut the size of a hen's cent. this he applics th the nipple to whim it firmly allheres, the workman meanwhile resting his blows-
 the rarpose: by the pressure of the pintil the ghane of glass is lattened as in $d$, fity. 11. 'The apquication

Fis. 11.
of a piece of irom, cooled for the purpose ly keeping it in water. to the junction of the glass with the how. pipe, detaehes it instantly, and the ghole of class is nuw held with the pointil. The operator earries it mast to the mose-hele (b. fis. 10), and presents the opening furmed ly the detachment of the how-pipe. tu the action of the furnace: this again softens the ghass, which is kept continually revolving le turning the pointil on an iron rest or hook fixel to the masonry of the furnace. The revolutions are at first show, lut are gralually aceelcrated as the softening of the glass wes on, and the centrifugal force so pronluced throws the edges of the orifice outwarls, as in $e$ fig. 11 . As the glass tlattens, it is revolved with greater rapichets, anil adwanced so near to the mouth of the mserinole as to draw the flames mitward, ly empracting the draught. This completes the softening of the ghas, which is hone suldenly, with a rushing nuise like the unfurling of a thiy in the wind, eassed thy the rapid himy outward of the suftened ghas and the rush of the flames ontwarls. it becomes perfectly that, and of equal thickness, except at the bullion or centre, formed, as before leseribel, by the lominn-bar aus the punty. The flasting is now eomplete ; and the work man removes it from the nose-lole, amd still continuing to turn it in his hands, in order to cool and larden it, as he walks along, carries it to the annealing oven, where another one reveives it on a large flattened fork-like implement at the monent the flasher, who has hold of the pointil, smblenly detacles it lyy a tonch of lis shears. It is then passed through the long horizontal slit which forms the opening into the annealing oven, and when fairly in, it is dexterously turnel on
its ende ; here it remains at a temperature somewhat helow that required to soften glass, until the oven is tilled with these so-called tubles of glass, when the heat is sufferd to decline, until the whole is cold, when they are removed to the packius-room, to be packed in crates for sale.
Futal lately, crown-glass was almost universally employed for windows, but now that which is called Giermian shet has hecome quite as common, besides which British sheet, which is the same glass $\mathrm{p}^{\text {wolishen, }}$ and plate-thlass are much used. The oberation of making the sheet-glass is very diflerent from that employed in makine crown-glass, inasmuch as a long and perfeet eytinder is sompht to be produced ly the blower instean of a sphere of glass. This necessitates also a different arrangement of the glass-house, as is seen hy the ground-plan sliewn in hig. $12: a a$ is the furnace, $b$ is the amealing oven,

Fir. 12.
heated ly the flue $b$, which opens into the main furnace; the leer, or annealing oven, is often, however, an indepentent structure: $c, c, c, c, c, c, c, c$, are the eight pots, which is the number usually employed in these works. These, of course, are opposite to the openings for working them, and in front of each opening is a long opening in the gromud, about eight feet leep, and three feet in wielth; $d, d, d, d, d, d, d, d$. The workman stands on the edge of this $1^{\text {int, anil baving made his gathering, as }}$ in the crown-class manufacture ( $a$, fig. 13), he next mavers it, without, however, using the bullion-rod (b, fig. 13). He next proceeds to blow his glass, hofling it downwarl whllst doing so, that its weight may witen and clongate the bulb, and from time to time dexteronsly swings it romb, which greatly increases its length ( $c, d$, fig. 13), As it cools rapidly in this operation, he from time to time places his filue in the rest which is fixed before the furnacemonth, and gently turning it round, he lrings it again nearly to the melting-point, then he repeats the howing and swinging, standing over the pit, to cuable him to swing it completely roume as it lengthens out. These operations are contimet until the eytinder has reached its maximum size, that is, until it is of equal thickness throughout, and suthciently long and broal to admit of sheets of the required size being made from it ( $e$, fig. 13). Sometimes these cylimlers are made 60 inches in length, allowing sheets of crlass 49 inches in length to be male from them. The next operation is to phace the bipee in the rest, and armly the thumb so as to close
the oprening at the llowing end; the heat of the furnaee soon suitens the glass at the closed extremity of the cylinder, and as the enclosed air is prevented eseapings as it rarefies, by the thumb placed on the opening of the blow-pipe, it bursts at the softened part (fig. $13, j$ ) ; the operator then quickly

Fig. 13.
turns the cylinder, still witl its end to the fire, aml the softened edges of the opening, which at first are curved inwards, are flethed ont nutil they are in a straight line with the sides of the eylinder ( $g$, fig. 13). It is then removed, and placed on a rest or casher-box, when a small punty of melted glass at the end of a pointil is brought by a boy; this the workman applies to one side of the cylinder, just below the shoukter formed at the blow-pipe end (fig. 13. $g$ ), and drawing it out to a thin string, wraps it quiclily so as to draw a line round the cyliuder; after a second or two, he withdraws this line of red-hot glass, and tonching it quickly with his cold shears, the shonder and neck drop off as neatly as if cut with a diamond.
The cylinder (fig. 13, $h$ ) is now placed for a short time in the annealing oven ( $b$, fis. 12 ), where it is prepared for cutting; it is next placed in a groove lined with green laize, and a diamond fixed to a sliding rule makes a perfectly straight cut from end to end. The split cylinder is then taken to the fluttening arch or furmace, where it is laid on the lottom, with the diamond-cut upwards. The bottom is a perfectly smooth stone, kept constantly free from ilust by the workman; here the heat is sufficient to soften withont melting the glass, and the lattener, as it softeus, opens the two edges of the crack until they fall outward flat on the stone; he then takes an implement in the form of a rake, made ly placing a piece of charred wood transversely at the end of a long handle, and this is gently rubbed over the glass, producing a very smooth smiface. At the back of the flatten. ing arch is an annealing oven, commnnicating with the areh by a narrow horizontal slit, through which the sheet of glass is now pushed on to a plate of iron, which receives it: and as this flate is one of a series linked together so as to form an endless band. which can he turned ronnd, the sheets move forward into the amealing oven, where the workman gently lifts thein on edge until the oven is filled, when, as in the case of crownglass, the heat is allowed to decline until perfectly cool, the sheets are then ready for use. Very much larger sheets are oltained hy this process than by the former one, hence it is becoming of great importance ; hut it is not easy to obtain workmen suliciently powerful and dexterons to blow and twirl the largest-sized cylinders; at present, we obtain almost all the operatives so employed from Belgium.

Glass-shades are made in the same manner as above described; indeed, they are nothing more than the rounded ends of the cytinders before heing burst. When wanted oval or square, these forms are produced by boxes of wood charred inside, of the size the shades are required, throngh which the

## GLASS.

cylinder is passed when being blown, until the soft glass touches, and receives shapes from the inside of the box or mould: they are afterwards annealed, and cut to the lengths required. If of large diameter, they require immense strength and great skill in the operator, who sometimes ails the power of his breath by taking into his mouth a little spirit, which he blows down the pije ; this, of course, is instantly couverted into vapour, when it reaches the red-hot cylinder, and by its expansion aids in distending the glass.
Plute-glass is made in a totally different manner : and as its value depends chienly on its purity, the greatest possible care is taken to procure materials
of the best quality, and almost every mannfacturer has his own private formula for the mixture. It may, however, he said to consist chietly of sand and alkaline salts, as in other kinds of glass, and the following is one receigt known to be in use: Fime white sand well washed, to free it from impurities, 720 lbs ; suld hate of soda, 4.31 lbs ; slaked lime, Sulhs. ; nitrate of potash, 25 lhs. ; and eullet of plate. glass, 425 lbs . These ingredients, wheu melted and skinmed, should yidd about 1200 lbs . of perfectly clear metal, which is the quantity nsually required fur a easting. When melted and ready for use, the pot is liftel out of the iurnace (an, lig. 14) by means of the forceps, and wheded ur to the casting-table

Fig 14.
(ce, fig. l4); here it is seized by a crane and tackle, by which it is lifted, and so nicely joised over the table, that it can be easily tilted so as to pour out its contents. All this requires so much care and steadiness, that the men, impressed with the great danger of carelessuess, usually preserve perfect silence during their trork. The table is of large size - 20 feet or more in lencth, by 8 or 10 feet in width. When the red-hot liquid glass is poured on, it immediately begins to spread; two hars of iron, a little thicker than the plate is intended to be, are quickly laid on each side of the table, and a steel roller is lail across, resting on these bars: this roller is worked by hand, and rapidly spreads the glass all over the table, the bars preventing it from running over the sides, and rerulating its thickness. In a very short time, it hegins to cool; the men then seize the end of it with pincers, and pull it forward with great dexterity on to an endless band of wire-ganze, which, being made to revolve, moves the immense plate forwand to a slit-like opening to the annealing oven (fig. 14, ff), where it is worked on to another table on wheels, which is pushed forward to make room for annther. The annealing oven is usually of immense length, as, in the case of plate-glass, the sheets cannot be set on edge. At the works at Nt Helen's, in Lancashire, where glass of all kinds is extensively made, there are usually two annealing ovens to each shed, the furnaces heing placed between them; each oven runs to the end of the shed, and these sheds are usually orer 300 feet in length. The ground-plan shewn in tig. 14 will give a gencral idea of the arrangement of one of these vast work-shops. The main huilding is a shed, with the doors at each enil, and both doors and windows are male so as to exclude drafts of air, which, if anditted during the operation of casting, are highly injurious to the quality of the manufacture. $a, a$, are the two melting-furnaces; $b, b, b, b, b, b$, the pots ; $c, c$, the casting-tables ; d. $d$, the endless bands of wire-ganze for moring the plates to the anncaling ovens; $e, e$, whore they enter
by the varrow openings, $f f$; and, after they have sufficiently cooled, are removed through the openings at each end, $a, g$.

The plates are next removed to the first polishing. shed, where each is imhedded in a matrix of stuceo, leaving one surface exposelt ; the whole is enclosed in a frame, which holds both glass and stuceo securely: Two of these frames are $\mathrm{p}^{\text {laced }}$ one over the other, with the two exposed surfaces of glass in contact. The lower frame is fixel, and the nuper is mate to move hy machinery with great rapidity backward and forward with a swingine motion, so as to describe an opposite curre with each hackward and forward motion. sand and water are continually thrown on the surface of the fixed plate, and thas the first stage of polishing is performed. The $\mathrm{p}^{\text {hates are then readjusted in the frames, and the }}$ other suriaces are brought upwards, and receive a similar rubbing down with sand and water. The plates are next removel to the seend polishingroms, where woneu are nsually emyloyed; here they are azain fixed on low tahles, and each woman rulis the surface for a long time with a piece of plate-glass, cowring from time to time the whole face of the phate with emery powder and water. After hoth shdes have received this hand-polishing, the $\mathrm{p}^{\text {dates }}$ are removel to a third room, where they are again imbethed on tables which are motable by machinery, so that the whole surface of the plate may be brought under the action of the polishers. These are larue movable hlocks, covered with woollen cloth and leather, and loaded so as to press on the glass; the polishing material used is eoleothar, the rid oxile of iron; this conpletes the prolish which gives so much beauty to phate-glass. It is a long and laborions process, and is the chicf cause of the high prive of plate as compared with other sheet-glass. British plate is only the cylinder glass polished by the processes just described; its comparative cheapness is due to the rapidity with which the cylinder can be blown. Of this rapidity, the best estimate may be formed from
a single well-anthenticated statement concerning the tirat Crystal l'alace, which han Is aeres of mof; when the sides are ahled to this, and a fair adition for the inerease cansed by the ridge-and-furrow system of the roof, the whole extent may be stated at oit aeres; and yet this rast surface of glass was supplied by Dusses Chance \& ('a of Dirmingham. with only an interrugition of three wecks to their ordinary business.

F'int-ghoss and Ophichl Ghes.-The general principle of the mamfacture of these twe varieties of glass is ilentical with those already describet, the chicf difference consistins in the great care taken to insure prereet punty in the materials. The pots used are so made, that the metal is protected from the elance of being contaminated by any accilental impurities falling in or from the gases of the furnace; they are made with a dome-shaped roof and a later:l arch-shaped opening (tig. T), which is placed (inmsite the fumace-mouth. so that the workman has easy access to the contents of the pot, which is necessarily smaller, otherwise the workman could nut dip to the bottom.

The materials used for the liest fint-glass are varied in their propertions, acording to the judement of the manufacturer; they consist of the whitest sand which can be frncurel, tine American pearl-ashes (impure carbonate of potash, which is pmritied by dissolvins wit the carbonate from its impurities, and evaprating it to drynuss in leaden evalorating lans), red leal, or else litharge (the semi-vitrified protoxide of lead), and a small quantity of nitre (nitrate of potash). To these, acconling to their sreater or less purity, the manipulator adds more or less of oxide of manganese and arsenic, as correctives; the former removes the green diseoloration which the presence of even a small guantity of iron in the sand will produce; and the latter corrects the tendency the manganese has to give a purple tint to the glass. Both substances require the utmost care and julment in their use, otherwise they are more injurious than lencticial. 'The following are the usnal pronortions: sand, 51: pearl-ashes, prepared, 16 ; litharge, of for rul leal, 29); nitre, $4 \frac{3}{8}$; white arsenie, $\frac{1}{8}$ : jeroxide of manganese. $\frac{1}{8}$ : enllet of tlint-glass in any proportion the manufacturer thinks proper.

Furmerly, the siliea was obtained hy calcining flints, hence the name applied to this kind of glass, but now sand is used instead; and although heautifully white sands are obtained from Lyun, in Norfolk, from the Isle of Wight and wither parts of Hamphire. from Aylesbury, from France, and even from North America anil Australia, it nevertheless requires most careful $\mathrm{p}^{\text {reparation }}$ by washing, calcining, aus sifting.
But however carefully tlint-glass is made, and however $p^{\text {ure }}$ and transparent the crystal may be which is so mate, it nevertheless possesses some defects, which interfere with its fitness for telescopes, mierosenpes. light-bonses, and other optical purposes. These defects consist in almost imnereeptible striw in the material, whieh ${ }^{\text {r }}$ roduce certain optical aberrations. These strise are known to be caused by the imperfect mixture of the materials, and the want, cunsentuently, of a uniform density This has heen obviated by M. Gruinant and his associate, 11. Frauenhofer. by stirring the metal in the pot with an iron roi; but grater imporements have been effected by our own chemist Firaday, whe nut only improvel upen the manipulation of Alessr's Guinaul and Frauenhofer, lut suggested also an inprovement in the materials, by the addition of carbonate of haryta and a little carlonate of lime, which prodnces a ghan of the ereatest density am clearness that has ever lwen kiown before. linsteal
of the iron rod for stirring, whiel of itself is apt to nisculonr the glass, an iron rod eoated with platina is used. In the manniacture of this particular kimb of glass, the Messrs Chance of Birmingham are unrivalled, and they have proluced very perfect dises for lenses, weighing as muth as two bumbed. weights each.
Finut-glass is employed in the manufacture of all the articles of ntihty and ormment fur table and other domestic uses: and as the manufacture of each article recuires different manarement, it wouk be inmposible here to give any satisfactory explanation of the manipulative processes. Suffice it to say, that at present Great Britain is unrivalled in the production of so-called crystal or thint-glass, which we manufacture of the ereatest purity and brilliancy; but in the colbured Kinels the Bobemians take the load, and excel both in design and in the art of colouring.

Huch tlint-glass is now moulder into drinkingvessels, bottles, and other common articles; but these are always greatly inferior to those which are made by the bandicraft of the regular glass. bower.

Coloured glass is a general term which inchutes several distinct varieties : first may be mentioned the glass made for windows and other similar parposes. Coloured sheet-glass is matle both by the crownglass and cylineler.glass processes. Sumetimes it is of pot-metul-that is, the glass and the colouring materials are all melted and worked from one potgenerally, however, this glass is of too dark a colour, and the himd ealled thented ghtas, is most generally used : in this, two pots are emplosed, one containing the coloured glass, as if for pit-metal, the other colomless chass. The workman makes his tirst gatherings from the colourless glass, and the last only from the colnared pot ; the consequence is that the glass when tinished, although it camot be jerceived, has maly a thin skin of the endored material on one side and the colour is thus as it were dilated. This has uther alvantages, because, by skilful grimbing, the colour may be renosed, and transparent patterns proluced on the coluurel ground; and the same may be done, and even delicate shading of the colon effected. by eating away the coloured side more or less by means of thuric acil, which is frequently employed, and most beautiful effects are protuced.

The colours usually emplozel consist of metallie oxiles, other substances are, however, occasionally usel. Gold, in the state callel Purple of Cussius, invented by Ir Andrew Cassius of Leyden in 16:32, and also in the state of a simple solution, without tin, yiells the most heautiful luby, crimson, rose. and pupple colours. Copper, as a sub-oxide, yields a tine ruby rell, and the black oxite gives an emerald green. Cubult yields the rich deep blues. Iron, as a protuxide, gives a dull green; combined with ahumiua, it gives tlesh colnur, or pale rose, and comhined with chluride of silver, it yields an orange yellow; as a peroxide, it gives a common red and a hrownish red. Silev, with alumina, also yields a sellow colour of great beauty ; and cummoner aul less beantiful yellow tints are prodnced by glass of antimony, and even by carbon, either in the form of sout or charcaal. Cranium gives the beautiful chrysurase green and canary yellow, with a slight degree of opalescence: it also gives an emerald sreen. Arsenic, or arsenions acid. protuces an opaque white. Manganese gives a purple or amethystine colour as an oxide; and as a peroxide, with a little cohalt, a fine garnet-red coluur. These are some of the materials generally employed, but there are numerous others, the use of which dejents upon the skill of the manufacturer.

## GLASG-GLASS-PALNTLNG

The aplifations of coloured glass to monamend purnows ate very anments; whe has alrenty beon

 "akeratly thuse of lahmmia, artiches of ormament and utility, comblinimg the most expusito combinations of form amb eobnur, are probued. Dut not the last interasting apphicatam of whared Hlass is the art of proxlucing wimhows axhibiting Inantiful pictorial designs. So lowatiful are tho designs of sombe of the winhows fommen from this matmial, that they deservedly rank as womes af ligh art. "lbis art orignater at the commemement of the ?th c., and receiver it. Ereatest derabor ment in the loth ematurs. It then hayan to decline, mitil, at the commenement of the present centurs, it was slowsy rovived, it tirst with lut little sulecrss, it emviotmon having bem formed that the trace secects of the art of proming the rich colnurs sech in anciont windows were loot. Cradually, chemistry and tha mionseope womed the umors, the fomer hamansating the exact constituents of the best kinds of ancont whass, enabled tha manafacturer to imitato it exactly: Still, howere, with the san incredinats, there wats a remarkable want of richness in the mondern material: the conse of this was revalad hy the microsoner, whill shewed that it was dene to minnte pores, which are frahame liy weatherime of the outer surface, the altahne parts of the equas beting washed mot, as it wore ley the ram, \&e. Thispormity, hy heakins up the sufface, westroyed the datness and glare of tho glase, and loy mixine more thomehy the rags of hight, pronneed that rinness for which the amicht glass is sofamons. Varime mothols were adoped to prombere this eflect: ohe which hecame common was, to stiplle the surface with dots of a dark uraple colour ; now it is sthll loetter and mone inerninusly fone ly spinklang sam thick by wer the gatherine of glass lafore reotiong the colowed cont, so that when blown and thand, it has the grains of samd thinly sattered thrmen its sulbstane, and these being refrative very stactssfully promace a rechasess nealy chal to that angureil by are.
So far, imbed, firm the art lecing lost, there is no dombt that a beoter material and leden colenes are now made; ant those whe examine the works produced ley Fallatyon, Clamer, mul other mannfacturers of our conntry, ame thise of Munich :unl other continental works, will noteasily belicve that the ancients wore mare sumessitul in their designs than the moderng. But besides the put-metal and flathed masses hofore mentimet, thereare two ather methouls of cilonviny and proturing pictorial chiots on glass. The tirst is ly staming, that is to say, painting the erass with varions materials, usually metallic oxikes tincly pwideren, amb mixed with oul of spike ur some ntin'r volatile melimm; the ghass is then fiaced in a furnaw, in which it is made reat hot, and a reep stain of the ehmar rumend is pros aluced on the glas. 'Phis process enables the artist to produce a complete phate on onde phece of ghass: wheras, by the older m.thon, the pieture hall to he made up of a vast number of phecess set in a slember lead-faming. (iemerally, buth methons are emplaged in pictorial wimbws, as the stamine enalus the artist to erive the hman fatures. But stamine deves not problne the same brillaney of eolour, and lessens the transparency of the glass, hence it is in luss estem.

A mother moke of derorating class is ly naine the opague or abarly opaghe enamel colous, and after the design is prombeed with the ge, to fix thent ly tirine: this is a beautiful art, and is varionsly cmployed.
lately, another and very rmarkable invention for deconatiny glass lras hecen patented by Al. donkert of bayswater, Londen-vik, the fixing of fhotugraphic juctures apm this material. The sonsitive salt ased to recospe tha ficture is one which will stain glass; therpore, on limur, the pheture is deeply lumed into the , elass, ambleamot
 natural lamdseapes and pictures may le transformed with most perfect fiduhty.

Giltens-grindin! and Enopreving-Glase man be ansily groumel with saml amb watep, son that the ormancutal chect of ressels amb other whects of thmothas may be vory greatly enhancel. Sant, lowever, leaves a romeh surface, and destroys the transmarency: lut thas is casily restored ly wther

The mulishing of lases for optianl instruments and for light-houses is an art of very croat impent. ance, requmber extramelimat skilh. Mach of the pulishing of the lamer lonsers is eflectad by the aid of machinery, and perhats mo rombinations of mechanical art are more womberful than the mathenes ly which the Messm Chane of lommingham polish the prims amb lenses for catoperic and dinptric light-henses.
(ilitss in a liguid fomm has lately luen extensively mate mader the mane of soluthe glass of silicate of sodir: it is silica, or sand, dissolved in a solution of canstie sula. This ligna, when used as a varuish, is said to protect stone and wther materials from the ingminus action of the weather, and for this purposi is nom molloyed to arrest the decay of the stme of the new llonses of Pombanctit. It is alon extmonely used in the mandiacture of soap (see Losty) ; and this, me a simitar soluble glass made with potash, has luen recommended to be unel as a dressug for monlins aml wher fathies tor fuber them tirmmof. The soluble soma-glass has almo low sumerssfully enployen in monnting mucrusconic ohjects, instead of Canada balsam or glyerine.
(GLASSPDINTING (in Art). The application of emaned enlas to the artistic decuation of winhaws has been previmaly abluded to, hat the vary high pusition which it fumedy attamen, ame wheh it is again madly apporninf, remders it mecessary to devene a shorit sprace to its relationship to the fince irts.

Grimally, there was but one nethond of makins ornamental glass windows, and that was to prodace the pattern in ontline with linely male leaben frames, into the ervenves of which pheces of condural ㅂans in of stained glass were titteld. Ahmern Memistry has, hasever, so improsed the ant of glasestainimy that lare piectures may mw be prombed on simgle shents of erlass, as in the" abse uf the winkers shewn her the St Melon's Crown cilass Company in the lishibition of 1hits. whe of Which, lesinmal liy Mr Framk Haward, remesentims "St Dichael ("asting ont the Great Brawn,' was unwards of mane feet high he threc feet broad.
 mitten to intense lowat fifteren times, notwithstameins whin it was purfectly shooth, and although sumwhat doficimet in brillimey of eolour, was an exerellent and atbective compusition.

Whe of the lust known of the enly applications of glass to the winlow decoration is that in the monastery of Tegernsec, in l'pher Bawaria, which was sectuarised in 180, and is now a $\frac{103}{7=3}$
resileme : lout thesin wimbows (exwatiod in the later balf of the luth c.), like all of that tirst attompts. were maly tasteful arrancoments of endomen olass in imitatum of the stome musaics used for thons, \&e. Xin dhe the art rise wath ahwo the for at herst there enturies after its argimation ; lout in the 13 th $\because$ owing to the full Nerelopment of the (anthic :tyle of architecture, it hecann of immense inport. abce, monord ulass taking the place of tapstried cartains in filluy up, the spaces within the gromed arches. The musatic patterns were supersented by Cabmate designs, not only in lumatiful arabesque and wher styles of a emative art. lint evompential conennitions were attompterl; and to such porfectim thil this arise, that many of the works proThed in the foth e are marrels of art. la all of these, the tierures, with the execption of the faces, were mate up of pinecs of self-colonred glass comhincel with great skill and taste; the fuatures were painted in aamel culous, and lomed in, and the art of the antist was shewn her giviug ease ame grace to the figures comespudine to the expession if the faces. "irmanally the at of shading, by removing certain protions of the colnured surface, and ather ingrovements were eflected. This was the culminatiog perint in the hiotory of the first period of the ort of erlass-pantines, is it is callerl, and sermed to have attamed the highest perfoution of which it is susceptille, for the efforts which followed to improse it hy assimilatian it to oil-paintines simally failed, and with this failure began that dectine in the art which was perhaps more remarkable in the instance of ulas-painting than in any other, for in a comparatively short time it lugan to be felt that the true art was lost. Sinee the commencement of the present century, rapid stribers have heen mall thwardz improvalient; and the renaissane hide fair to celinse the gheny of the tirst poich. The freat suats of this art are now in Munich, Nurnhers. I'aris, Himinghom, Ehinhurgh. and one or two mare flaces a and it never revelvel more liberal patronage in its palmiest days than it now does.

CLASS PAPER, or CLOTH. is mate ly powdering slass more on less timely, and spinkling it wew bayer or calico still wat with a cont of tho shac:
 is rery extmsively emphyal as a means for pulishing metal and wond-work; it is soll in shects, and is wery laryely manufictured at birmigham and wher pluars.

GLA'SSCHORN, a musimal instrument, with leys like a phanforte, hut with lars of glass instead of striugs of wire. It was invented in laris in 178. ly a terman callod leyer. The name glassehord was wiven to the instrument by pranklin. When the flasselome was emmpleteil, it was exhilited puldicly in laris. and perfurmen on by the imentor: lant it never was received with fanam hy the instrm-ment-makers, so that momere wre crer made, as persilly its com-truction and mechansm remained in sceret with its inventor.

GLASECRABS (Ihyllosmmita), a fmily of crusthecans, of the division Ifellonstreter, wher stomot fonle of cowier, remarkable for the transprency of their borthes, whence their 1 whlar name, whilst the semontitio name (fir leaf-bonty) refers the the oreat hurizontal expansion of the earapues. They have fittle resemmine tocrahs. The hew is representel by a laten wal jhate, learing obes mometel on very ling stalles: a secoml plate, the breatth of wheh mueh execels its length, represents the thmax, mel lears the foet, mest of which are lours ant sume of them, is in a few other crustavens, hifis, with ome branch muels loger than the other. The abdomen
is small. Dilne-Ehwarts smpuses these creatures to have uo precial or caus of respiration, lant that the bood is airated through the general surface of the

Gilass Crat:

GLEIG, the Rey, George Romert. M.A., a popular anthor and divine. son of the light lios. Georme Glein, LL.1)., Bishop of lirechin, and Irmus - A the Soots lipiscond Churh, was homat Stimime.
 the miversity of Oxford, he jomed as a volunteer a reminent then marchime through that city on its way to lishon. Kuon obtaining an commission in the s.ith liegiment of light infantry, lue servel in the Peninsula. Durius the American war in 181:-1814, he was engaged in the campaign of Washington, at the capture of which city in Angust 1514, he was severely wounded. in 1 sill he publisherd an account of tire C'amprigns of H'ceshington and I'elu Urleans, Sro. At the cluse of the war, he
retion on half pas: JIe now comphenl his sturties at Uxiod, enterid into holy urlers, ind in 1822 was presenter ly the Arehinshon of ('anterhury (1) the living of loy Church, keat. In lsen, he mablishat The sutultern, a nowed foumder oul his enperticnce in the Peninsular War. Jn 1s4, he was appuintert chalplain of Chelsea I Iospital, and in 1st6, Chatain-sameral of the Furces. Dlaving devised a s.lame for the education of sombirss, lie was appointem haspector-general of Military sthomla. la lats. he was made a prebemdary of it l'aul's ('atheilat, Lomdon. G. has written a great varicty of biographical, historical, and rehigions books. The most interestime amb immont of all his works is his hifi of the Cireat Duke of Irellington (1sj!, new cd. 186\%).

GLLELWITZ, a town of Prussia, in the somth-east of the province of Silusia, is pheasantly sitnaterl on the litentuite, a small afluent of the Uiber, 43 miles sumbh-cast of Opreln. It contains three ehurehes, a symange, ant a Catholic symmasim, and is noted for its royal foumbres, iron-works, leather mannfactures, spinning aml weaving. F'op. 9757.

GLENCOE', a valley well known unt mily for the terrible massacre throngh which it has become listmically fanmas, lont also for the wilduess and sulhimity of its scenery, is sitmated in the north of Arsylestive, near the lomer of Inverness, at lonch Leven. It is about eight miles in lensth, and is divided intos an upper ant lower valley loy a gentle riblese. It is traverscel by a monntain-strean called the Cona, and its searrul sides shew the heels of humerous humatain-turents. After entering the glen, the travelter lowks in min for any token of social life of of civilisation- Masicher of Gisscoe. The principal circumstances of this famons trasely are luriefly as follows. The state of the Hifhants in the year which followed the partiamentary session of 160 was snch as to wive the gowemment much anxiety. The civil war wheh houl recently luen flamisy there eontimus still to smoulder, imel at lenath it was detemimel, at
 and reconciling the refractory clims. The Edinhargh authoritios issucal a morchatiom exhorting the dans to submit to Willian and Mary, and oflerins pirdon to every rebel who wonk swear on or hefme the $31 s t$ Deember 1691 to live pate ably under the goverument of their majestices, and threatening to treat all who refused to do so as enemics and traiters. All the ehiefs summitted lofore the :3nt Jocembir except Daclan, the chicf of the Mationalds of Glencot, whose summiswion. from monorseen canxes, was relayed till the bth of Jimuary. The magistrate hefore whom he towk the wath of allownce transmitted a certilicate of the Comacil at Edinhureh, explaning the ciremastances of tho case. "That certhitate was neme lath hefure the ('mand, lat was supmese ed by an intrigue. "lirement (it is smpused) ly the Master of stair (wir dunn balrympe, afterwards secomb Viscomt ank 以ial of Atair), on whm, modoulterly, rests the chid hlame of this ollots transaction. The (ammins of Maclan now hariol on their phans for lis restruetion. The Dastor of stair whtanel the king's sipmature to an order directed to the emmmanter of the forces in reotiand, and which roms thus: "As fan Matian of cifmene and that tribs, if they can be well distinguished from the other binhanders, it will be proper, for the vindiation of publie justice, to extirpate that set of thieves.' Areorlingly, on the 1st of Fehrury, 120 soldiersmost of them Camphells, who had a personal spite assinst the Mactomals-ledby a Captain Campull ant it Licutemant Lintsay, marehed to Gleacoe.

They had been warned by Stair th do mothing by halbes ; they were exhorted to be'sectet and shimden:' and they obeged their instractions. Arivel in the ghen, they tuk the (ithone men that they were come as friculs, and only wated puarters. Fine twe days the suldiers lived in the glen. "aptain Cmmphell, or Cilenlyon as he was called from the mame of his cstate, while visiting daty at the chicf's loonse, employed himself in inservines carefully what aremues and passes there were by mans if whish the Machumalds might escelphe and reportins the result of his olservations to Linutemantcolonel llanilton, who was approaching with troms to secme the 1 asses. The morning of the $1 ; 3$ th of Fobruary was fixel for the shanghter, and on the night of the IDth, (ilenlyon was suphing and playing at cards with those whom he meant to assissimate lufore dawn. At five in the morning the muderous work began. When the day dawned, :S corpses, amons which were sescral of women, ims hore drealful stin, the hand of an infant that had been struck off in the marderous tumalt, were lying in or armand the villane in their hool. but the massacre comprehended only a suall prortion of the tribe, for Hamilton not having come up in time, the passes were open, and about 150 men, and probisbly as many women, escaped, but only in minny cases to prexth from cold or hunger among the snows in the high monntain-gorges. When Hamiltm did arrive, he was disapminted in fonling the work so innperfectly done, and scizine an ohi Hishlamler, whm, leing above seventy, the other lutelers liad aured to let live, murdered him in cold blowi. The hats of the rillage were then set on fire, ami the troups departed, driving away with them all the flocks and herds of the glen.

The prestion as to the share of Ving William in the guilt of this transaction has bern discusser with ghe little warmily on both sikes. Lomd Macaulay pleads, in sindication of the linges conduct. that the certificate detailing the sulmission of Maclan had heen suppressed; that he knew the Natemalis unly as a rebellions cana, who hat rejecterl his eonciliatory offers; and that, in signing the onder for their extimation, he certainly never intembed them to be murdered in their slepe, lant merely that their orgamisation as a melatory gang shomblt be broken m,- The seene of the massaere is visited amually by towists, who are aceommodated with converanees in connection with Hutcheson's steam-vessels from Glasgow.

GLENDOWER, or GLENDW R, OWEN, a Welsh chief, who was one of the most active and formidahbe enemies of lfenry IV. of Enytant. He was descoula from Llewelyn, the last Prince of Wales, ame foblowal the furtunes of Richarl 1 I . to the close, When, in lisy, Menry of Bolinghroke nsurped the chow, and assmed the title of Kine llenry IV. 'l'aking alvantage of ( C 's known attachment to the dethrmel momarch, Lord Crey of Rathyo sided part of his lounl. 'r.'s suit for its restitution was dismiss ol ley darlimment, and then Lamblirey seized the rest of his lanl. Revense and despair, eonspiring with a martial disosition, and the cheourang prophecies of the Welsh hards, Arove him to take up arma, ant provited him with followers. In 1400, he commenced operations by seizing the estates of bonl tirey. The king orderal lis subingation, and sranted lis estates to his brother the liarl of Somersitu. Gi's fonces were inforior in number to thuse of his alversarics. He was smmetimes victurions, chietly through surpises, ambushes, and the like, but sometimes defeatel, and forced to retire to the hills, where his positions and rule fortifications combl not be approached. In Itoz, he drew fond Grey into an ambush, and took him 1risoner. This

Many attompts have boun mat to exphin the arigin of these remakable shatwo. Then forming somewhat lesel roats aromen the vallos, originateot the penplar notion, that they were made for the convenimee of the hermes whose explnits are sums by Worian. l'layair, in 1416, supposel they were aypenturts for artiticial irrigation. Dneculloch lonlecerd them to be the shme lines of fresh water lakes, which eramally washed away their hamiers, remamine for a bonger space at the lowigh of the varions shelwes. 大ir T. J. Lander cmbraced and illustrated the same view. lharwin consilered that the chens were former arms of the sea, and that the shelses impleated perimels of rest in the clevation of the lam. Agassiz and linekland returned to the - p inion of Macentorll, but fintines no indieation or remans of any solid land barrier, they refered the lake to the glacial priod, and held that two large
glatiers came down from Ben Sevis, the one near the cantre of the mountain, and the other along the losin of Loch Treite, amt that these damued up the water in the included portion of cilen spean and in filomruy. In a paper subsequently published ly Mr Davil Milne, the lacustrine theny was reverted to. with sereral new and plansible illustratims. The reader is referred to it worle of Mr 1. Chamlers (Ancient sere-maryins, IStS) for a full acomint of this remarkalde district. Ite ennmerates no less than $2 l$ terraces or shmes, in addition to the fumr prominent ones already ilescribed, at heights varying from 325 to 140.5 feet. . Tod uniting all these finto a rembar serios he enicavours to shew that they are owing to the recessing of the sea from these glens. and that the intensity of the shore-markings dopented upon the angle at which the lill met the water, the nature of the smface of the hill. and the quictness of the water.

GLESTITAT, a deep, narrow valley in the north of Perthshire, extends in a south-west direction from the Crampians on the north to strathgary on the south, and is Is miles in lunsth. Through the buttom of the glen the Tilt rushes with weat impetnosity, and the montains on each sile are scorel with immmeralne torrents. Its upher half is enclosert amoug montains of from $32: 0$ to 2589 feet hich, and its left boundary is mainly formed by the huge Ben-y-(ilue, which rises frmi a broal hase, and has many summits, the hinhest lueng :ionfeet abore sea-level. The lower half is less wild. This glen is classic ground to the seplorist. Two clahorate accounts of its peological phenomena have been pullished-one I, In N Culloch, to be fomal in the Tranactions of the trenlogical Socicty: and the other by Lond Weeh, seymonr. which ippears in the Transuctions of the Royul Suciety of Edmburgh.

GLIDDON, Gennge I., American Eghtolngist. antiguary, and cthnologist, Was horn in 1507 in Gram Cairo, Egyt, where his father, John Gliddon. was for many years United itates consnl. He resided for 32 years in the valley of the Nile and in the Levant. and had extraordinary opportmities for pursuing those schatific reseasches to which he appars to have devoted a large portion of his life. He tilled. for several years, the post of United States ennsul at Cairo.

About the year $1 \mathrm{~S} 40, \mathrm{Mr}$ ( a . visited Lomion, Paris, and his own comery, to which he had heen so entirdy a stranger. In the United states, he wave lectures in all the principal cities from Jostun and New Tork to Molite and New Orleans on Exyptian and other Oriental antiquities. His carliest work, Anciont Egint. her Monmments. Hicroo Ilyhites, Mhatory, ant Archoolog!, \&e., was sa shecessful, that is, 100 condies were solt in America alune in three years. It has passul through many culitions. Ife "mblished alsu, at about the same perind, an Apmet to the Antiqurviss of Eurmpe on the Drstruction of the Momuments of Eithot: Dis-
 Cothon of Lomit ; and (Hice Exymptiaca.

In the conrse of lis travels in the Thied Sitates, Mr © . formed acepaintances with mon of seience who were interesterl in bis Epyptian researches, aml who in turn, interested him in a broaler range of ethulogical investigations. Fmppicnows amony these were Dr Aheron of Philalupha, distinmished fur lis cranulonical investigations; lor Nott of Mrobile - Habama; Prufessor Iqassiz, the naturalist: and others. He wishod now to avail himself of the alvantages of Euronean museums and hitraries, lut lad mut the necessary means. He fumbl, hums"wor, a gomerous frichl in Nr lachard le. Iaicht of Nuw link, who innurted costly works from Eurne,
pot then to he found in America, and also furnished him with money for a visit to London, Paris, and Berlin. The results of his studies are to he found in two quarto volumes, published ly Mr ( $\%$, with the en-operation of Dr Nott, and several other savants, lonth Duropean and American. In 1sist was pullishel Fines of Menkind. or Ethnoloytival hesearehes bused upon the Ancient Momements, P'uintings, Sculptures, and Crania of lures, dee, by J. U. Nott, NI.D., of Mobik, Alabana, anl George R. Glidon ; and containing papers by Ir Morton, Professor Agassiz, amd Drs Usher anit I'attison of Philaduphia. In ISJす was pullishel, also in a lanulsone quarto volume, Indinenors linces of the Leth, or Neur Chopters of Ethotoyicet Inquiay, incluting Momegraphs by M. Altred Mary, Librarian of the Fronch Institute; Francis Inlszky, a leamed Ifngarian: and Professer Heigs of Philadelphia. This work lears also the joint names of Nutt aml G. : ant Mrs Glihlon, an accomplished artist. gave ber assistance in drawing upon the wood the engravings with which it is profusely illustrated. Inst as this work was publishesl, Mr is. died at l'anama, Isthmus of larien. whither be haul gone to pursue his ethnological rescarehes.

A1r (r. was an enthmsiast, not only in his investigations. lont in the adrocacy of his theories or convictions, and is unsparing in his eriticisms of his omments. He has libourel to prove the ureat antiquity and liversity of origin of the human races. His worls have been severely eriticised and comlemmed loy those who hod to the popular chronology and the unity of the race. The materials he has lrought together are valuable and suturestive; lut his treatment of them can searely be considered satisfactory; and he is not free from the suspicinn of a bias in farour of the enslarement of certain of those whom he considered inferior races.

GLI'RES (Lat. phral of glis, a dormonse), in the Limmen srstem of zoology, an order of Mammalia almost exactly comesponding to the Rorlentic (d.v.) of Curier and other more recent naturalists.

## GLOBE-FISH. See Dionor.

GLOBE-FLOWER (Trollius), a gemes of plants of the natural mider Rimunculdcce, having a ealyx of coloured (vollow) supals, in mumber fire or some multiple of five, the letals small and linear. There are several species, natives of the cumer parts of the northern hemisphere. Whe common fo.. the Latien duman of the Scotch (T. Exaropurns). is the only spucies fomm in lititain, aml elicdly in the inerthern parts. where it is cur of tho finest crmaments of moint gromits and river-lembs in somewhat elevater listricts. It is sonetimes cultirated in flowergathens. The name $\mathrm{t}_{\mathrm{t}}$. is lerived from the apmourance which the

Clune- Flower (Trollius Europe (u.). fhiwer presents, the sepals loning eurved sa that it fomms almost a perfect yodnow glome or brall. It is a mative of all the urntheru parts of Eurore, and also of the $\$ 1 p_{\text {ps }}$.
(aLobibx. A glowe is a round or spherieal boly (seespmetis), and in the singular number the word is
oftenused to signify the earth, as in the phrase ' the terraquens globe;' but by 'glabes,' or 'the globes,' we usmally mean a pair of artiticial ghbes nisua as a part of sehool-room appratus. These ghobes are hollow spheres of carel-losiarl, coated with a composition of whiting, sfue, and oil, $y_{1} n \mathrm{n}$ which paper hearing certain delineations is laicl. On one of the pair-the celestiol glohe-are represented the star:, so placel that, to an eye supposed to oliserve them from the centre of the coloce, their relative position ant distance correspond to those actually observel : while on the torrestrice globe, the distribution if land and water, the disisions and sublivisions of the former, together with a few of the most inmertant places, are lain down in the positions correspmating to those which they actually occupy on the surface of the earth.

The usual mole of manufacture is as $f$ mows: it ball of wool or iron is used as a matrix, and a layer of damped ${ }_{1}$ aper is carcfully and closely phacel upw this, without paste, and other layers are sucecsively pasted over the first one; ordinary card-hord is thas produced, lont instead of heing that, as usual, it forms a spherical shell. When sullieicntly thick. this is cut inte two hemispheres, the sectimin being male in the line uf the intendel equator. The hrmispheres are then taken off the matrix, anil again phed together on an axis, aml the whiting composition laid on, the outsile of whieb is smotheal ima finished to shape in a lathe. The workman his tu lay on this cumposition su as to balance the glole, in order that it may rest at whatever mint it is turned. The smouth surface is now maked with the lines of latitude and longitude, and is eovered with the paper on which the repures geographical or astronomical delineations are encraved. In order to adapt the plane surface of the paper to the curvature of the sphere, it is printed in pieces, small circles for the Arctic and Antarctic regions, and the . rest in lens-shaped gores, varyint from $20^{\circ}$ to $30^{\circ}$ of longitule, and meeting these circles which are grasted first. Great care is requirel in laying on these curved pieces, so that their edges shall meet exactly without overlapping. The surface is then coloured, and strongly varnished, and mounted in its frame and stand.

Glohes of india-rubber and gutta-percha have alsn been manle, others of thin paper, to be inflated and suspended in a school-room. jects's paper-globes fold up when not in usc. Embossed globes shew, in exaggerated relicf, the elevations and depressions of the earth's surface. Cumpound globes including the celestial and terrestrial, are made with an outer glass sphere for the celestial, and orrery mechanism to shew the varying relative positions of the sun and moon, \&c.

As school-room apparatus, gloles are used for the purpose of illustrating the form and motion of the earth, the position and apparent motion , if the fixed stars, and for the mechanical solution of a number of prohlems in geography and practical astronomy. For this purpose, each globo is suspended in a brass ring of somewhat geater diameter, ly means of two pius exactly oprusite to each other-these pins forming the extremities of the axis round which it revolves, or the north and south proles. This lrass cirche is then let into a horizontal ring of wool, supperted on a stand, as represented in the art. Ammiliant simpis: in which the lines drawn on the surface of slobes are also explaincel. The globes in common use in schools are 12 inches in diametor; those to hin found in private libraries are more freguently is inches.

The prohlems to which the globes are aphlied are such as: To find when a star rises, sets, or comes
to the merilian on a given day at a given phace. The monle of solation will be fond in any schmil. hash on the suldect. The answers oldaineid in thas way to such questims are ouly very rough approximations, and and in themselves of litto or nu value. lint 'the use of the glubes' as it is callond, serves the purpose of makine evilent to the suses how many of the apherances cunneterl with tha motions of the carth and the hatrenly hombins are cansed. and emabling the nature of the prohems enumetoll with these apmaranees to be charly concement. It is only ly trisomonetrical calculation that the aecurate sohitions can lise obtaine i.

GLOMULINE, of CECSHALJTOE, is one of the proteme bandies of albuminatos. In assenciation with hamatine, as hamato-flohulin, it is the main ingredient of the lomed ghombs: and it eroms. mixel with allhanen, in the cells of the erystallin. lus of the eve, formine, accondmes to Nimin, fron 10 to 14 fur ecnt. if the elry lens. Hene its tw. names. In most of its retations it resumbles athinmen, but differs from that sulastance in lome prove pitated buth from and and athaline shatums hy "xact hentralisation, and in being complaty thrown duwn from its solutions ly carnnic acit gras.
 the name aplieal to a peenliar semation described under lorstenin.

GLOCKNER, or GROES GLOMKXER, the highest peak of the Noric Alps, is siturten on the bumbary lotween Tymb, 'arinthia, and Cpur Anstria, and is 12.431 feet in luchent.
 imprant fortress of l'ussia, in the prowince of Silesia, is sitmaten on the left hank of the Uler, 85 miles noth-north-west of hernit\%, It is sumroumbed ly walls, sut is otherwise fortititat ; ath is connected by a wooden latide with a strmoty fortitied island in the Oler. It has a bantint castle, two gymuasiums, one Catholie, and the other Protestant; and nmmernis religions aml educational institntinas. On the island in the Oder is a cathedral dating from 1120, and containing a Mialomna, the masterpiece of Cramach, Sen. Mannfactures of woollens. printed callens, hosiery, tolacen, papre, and sugar, amd sme trak and comnerce are carrical on. 'opl. 16,650, including a garrison of 8653 men.

GLOGGNITZ, a small town of Anstria in the province of Lower Anstrin, is sitnated on the Schwarza, at the northern lase of the Semmerin: Alp, a manch of the Soric cham, 4.5 miles sonth-south-west from Vienua. Iolo. Ieno. It is is station on the Tiemna and Trieste Jailway, and stames at the northern extremity of that portion of it known as the Semmeringlath, of railway of the Semmering. This portion of railway is perhaps the most extraordinary work of its kimd in Lurape. It sweeps up the stecr rocky face of the monntain in many unves, and lescomls its sonthrm slope, after having passed throngh 1.5 tumats and crossel as many hrileres. It extends from Q. on the north to Murzanschary on the sintle, a distance of as miles. The createst clevation is reacherl $23!$ miles smath of $r$., where the line is $\because 572$ fect alove sea-level, ame lima fact above its hoioht at Glogenitz. To this pmint the line rises in urailents of from 1 in 40 to 1 in 100 ; the average rate of ascont. bowever, is 1 in 82 . At its gratust chvation, the line pierees the sommeriner in a tumel 4633 feet long. Quisk trains taks. I lour and 42 mimutes to traverse these 25 miles: slow trains repuire 2 hours 33 minutes. "The semmeringhuhn was constructed fur the Austrian goverament liy

## GLOMAEN゙-GLOLCESTEN.

C'anlo (heras, an eminent engineur, between the years lsts and 1803.
(iLOMMEN, us Som-Eiv (i. e., areat river), the largest river in Norway, rises from Lake Aursmel. at the town of Jions, in lat about 6o for N., and lomer. $11^{\circ} 16^{\prime}$ E. lts somree is 2419 fect above seablewe and its course is intermpent by frequent water-ialls, the last of which, with a descent of dil feret, is called tha Norlenfos or Sarp-fos, and oceurs at alout 10 miles from the munth of the river larae lanats can ascend to the sarpentows. 'libe 1i. thows first in a sonth-west direction for almat (a) mikes. then lemels tomyarl the sontheast, ind formes that directha until it prasses the fontress
 west, and empties itself into the skager liak at Fremerickstadt, after a course of abont 400 miles. Its most important affluents are the liena on the leit, and the Vormen on the right.

GLu'R1A, ir hymn in the Roman Catholic Chureh serviec, lewiming with the words, "'loria in excelsis 1)en.' Its place in the mass is after the "Introitus.' except on the renitential days in dreme and dhariof Lent, when it is omitted. It is fommeded on the 21 chapter of sit Luke, I4th verse. It has been so lonse in use that it is not known ly whom it was intronlncel juto the service in its present form. lt is also calleal "The (ireat Iowolong. to distinguish it from the "Xioria patri filio et spintui,' which is sume at the end of the I'salms and antiphonal liymans.

GLORIOSA, a genus of plants of the matural order Lilluept, having a perinath of 6 elomeated and retlexel strments, a $\boldsymbol{i}$-lobed stigma, a 3 -edled superion gerumen, and glubose seeds. The best known species. $G$. sumpulat a native of 1 mola, is a herbaceuns premmial with a wati stem, $6-10$ inches high, alternate loaves terminating in tendrils, amd very leantiful flowers, finely coleured with red and yellow.
(:LORIOUS VHICIN, or ST NIRY THE FiLOlilotes, an mater of knighthood in Venice, founded by Barthonmew of Vicenza, aul aprosed ly I'upe Crloan IV. in 1262. This institution was cerelesiastical as well as military, aml its olojects were the pontection of whluws and orphans, and the fortherance of the peace of laly. The badge was a pmole eross between certain stars, amd the costune a white surcoat ma lusset eloak.

An wrep of knierhthome of st hary the Glorions also exister in limme in the 17 the c. whome purpose was the supmassion of the barbary cursars who infester the Mediterranean.

GIJOsi (in Lillical criticism). Cr. glensa (fonsme, or lansmage), an explanation of furely verbal dithenlties of the text, to the exchasm of those which arise from dectrinal. historical, ritual, or ceremmial sumrees. The words which are comnomly the subject of these glussarial explanations swe renducible to tive classes: (1) foredun worls; (2) povinctalinms or elialects; (B) obsulete words ; (4) trelmical words; and (5) words used ly the author in some almmmal or exceptional sienification. From an early periot, these vorbal dibhenties were the object of attention, and the writers who dwoter themselves to the chendation were called phossoto Greck glossatores are 1 esselins, Zonaras, Suidas, I'hasorims. Nust of the Rabbimeal writers lave clone the same work for the Hebrew text: so that it would bre ditlioult to name any in particular as Thelrew ghossatores. 'lhe chief irlussatores of the Latin Vibsate are the eelebrated Walafried Sitowho in the Oth e... and Anselm of Laon in the lath, for the Latin Vulgate.

In Koman ame canon law, the practice of introducing glosses was of early origin, ancl probalily was an imitation of the billicall glosses. Ansmis jurists, the gluss was nut purely verbal, bat regaraled the true interpretation of the law, and in some cases it was held to lee of equal anthority with the text itself. From the prosition which it oceupied in the M心., being generally written between the lines of the text and on the marein, it was called glosser introlineariz, The gloss of the Koman law is written in very pure latinity, that of the canon law in the Latinity of the nedieval schools.

GLOSsi'TIS (Gr. glosso, the tongue), inflammation of the tongue. The elisease in its most acute form is rare; it is sometines dhe to injury, of to seald; in other cases, to the action of mercury on the system. "Ihe tongue lecomes enor. monsly swo\}len, and one of the chief dangers of the attack is suffocation from swelling of the parts about the byoil bone. amd closure therely of the glottis (see ]anisx). The only really effective treatment is to make jretty deep incisions into the intlamed part. keeping in view that the resulting womm is likely tor be monch less than appears at the time ; for the enlarrement of the organ has stretched the mucoms menabane, and infiltiated all the textures with fluid, while the vessels also are distended with blood. A straight bistoury shonld be hollly glunged into the upper surface, and several incisions made lengtliways sufficiently deep to evacuate the contined thinls. A good deal of blood will usually follow, hat if care has been taken not to injure tlee lingual artery or its branches (see Tunge , there is no real danger from this cause. In places at a distance from medical adrice, this operation might require to be performed by unskilled hands, and with a penknife or any otlier conting instrument at land; care shombl lie taken in this case to make the incisions on the apher surface, and not too far from the middle line.

## GLOTTIS. See Lirys.

GLOU'CESTER, a city and county in itself, the chicif town of the comaty of the sanie name, an inland port, cathedral town, watering-place, and the seat of some important momufactures, situated on the left lank of the river severn, Jistant west-north-west from Lomdon $10^{-}$miles by road, and 114 by rail, and from Bristol 36 miles north-uortheast. (t. is clean and well bmilt, with four principal streets, of convenient width, meeting at right angles in the centre of the city. The docks are spacions, and conmunicate with the olen burt of the Severn, below sharpmess loint, ly means uf a shipreanal 17 miles in length. while the whirfs, abont 1000 feet in lengtl, are direetly commected with the several railways. The foregin trale is prinerpally with the Hack and baltic seas, C'anala, the West Indies, and lirance; the foreien inmort returns for 1861 vive 45 vessels, and an igrgumate tonnage of $1: 30.947$; exports, 95 ; tomnagr, 20.676 . Constinstrade inwarts, 994 vessels, of to, 5 St tons : ontwards,
 Dhallan lailway with the north, loy the liristol and diloucester Railw:y with the west and sonth, by the Great Western with Lombon and the east, and by the sonth Wales Railway with the principality. latsides affording a market for the froduce of the surroundine districts, (i. imports corn, timber, whes, and spirits in conswleralne quantities, has a large export trade in iron and stecl roods, coal, somp, malt. and potter-ware, railway-fittings, anricultural implements, bells, $\mathrm{p}^{\text {ins }}$, chenicals, and hempen goonds.

GLOVEle. Ficharn, was lurn in Tondon in 1712, anl w:as chlucatel at 1 "buaw, in surrey. He was a morehart in his mative citr, and in Jatit, lnecame member of garliament for Whymontla. ITis first pum, to the memory of Sir Isame Sewtom, was written in his 1 bith year. IIs ehief poom, entitleal
 several . ilitions. A continuation of it, the I lhenade, was puldisher in 1757. Those purms are in hande Varse, and uf prodiginus extent. Althonith mot deficil he in a coltan majesty and eleration of tone, they are in the nomin twrid amd leary, and are now almost entirely formoten. Ihe wrote several tracedies, which will not meet with suceess. His mont popular jwem. /henier e liloost, writtela on the takine of larthagena from the Spaniards, was pube lished in l-3.3. HL dient in 1.55 ; and in 1813, alpeared a liary, or pat of a diary writter ly him.

GLOVEA. (ilues are male of varions materials, such as silk, worl, linew, cutton, fur, and various kimes of leather. The latter material is the most abmolantly uscel, and the monle of making it up is the most characteristie of this branch of mambfacture. We neal scarely inform the realur that the term "kill" is a nure techuicality, as the quantity smmally consmmed of leather bearing this mame is largely in excess of what conld be supplien from the skins of all the yound fonats that are ammally slaurhtered. It is chiedly male from lamb's skin. A few of the tinest gloser are made from real kid skins, olstained from those countries where guats' milk ami thesh are anticles of fooch. bueskin, buckskin, and doeskin glnes are mado chichly from sheepskin; some of the thickest kinels of luather gluves are made from calf-skin $\qquad$
leather in all cases umberges a much lighter dhersine than when red fur boots and shows.

Worester is the chief seat of the Lmalish leather clowemandactory: gloses are also made at Loullow, Lemminster, and Y'oril, besiles Woodsterk, where an feculiar and superion dueskin oflase is made hearing the name of the town. Limerick and the neighourhood hats loug leen cetebrated fur slowes.

The lirench, bowever, still axel us in this liranch of mandiacture. El to 1se5, the importation of French gloves was prohibiterl, and the competition conserpat upen the remoral of this prohinition hat the nsual offoct of perbueing a raph improvement in the lendish manufacture. Very eheap and gome gloves are made at Naples; and they are much in request on the ematinent.

Ater the leather has been properly preparel, it is cut into pieces of the repuired size, then folled over somewhat uncrually, as the back shomble berarer than tha front. Three chts are then make through the donhed piece to produce the forr fingers; an ohbong hole is cut at the bending of the fuld fur the insertion of the thambrpice: the cutting of this of the exact shape and size repuires considerable skill. 'The first and fonth tingers are comphetel liy gussets of strips sewed inly on their imore sides, white the second aml third fingers require frussets on each side to complete then. Besides these, small pheces of a diammol shape are sewed in at the hase of the hingers towarts the palm of the hand. The stitching together of these pieces requires much care, as the junction must le made as closely as possible to the edge of each pisee, aml yet with suthieient hoh to lieve, the stiteles from cutting through the material. A kind of vice or clamp, with minute teeth to regulate the stitehes, is sometimes used for this frupuse; and sewing-machines are applicd as far as practicable, especially for the ornamental or embroilery stitching on the lacks. The putting in of the thumb-piece requires special skill and management. Dadly made glowes commonly give way at this part. The superiority of the French and the lest English gloves depemels ehisuly ${ }^{n} \mathrm{~m}^{\mathrm{m}}$ the alaptation of their shape to the structure of the hand by giving adnlitional size where the flexure of the hand requires it. The best Woollen, thread, and silk gloves are made as above by cutting and sewing together, but commoner gloves are mule to a great extent by linitting and Weaving in like maner to stockings.
Ghoredyeing.-The dye is lightly washat nver the stretehed glove, a second and thirl eoat being given after the tirst is dry. When this is thoroughly idried, the superthoms colomr is rubbed onf, and the surface smouthed liy rubbing with a polished stick or phee of iwry. 'The surface is then sponged over with the white of ega.
fiforecocening. - bll of turpentine or camphine was the material chiefly used fur cleaning kid gloves, but uf late this has licen to a great extent superscied hy benzole (q. $\begin{aligned} \text { ) or lenzine, which is abumbantly }\end{aligned}$ whtanal in sutheient purity for this purnse by the curcful rectification of coal-naphtha. The chief culvantages of this latter material is, that it is more watile, anl its odour less fersistent than that of womary turpentine, or aven of the best rectified camphine which has been 1anch exposed to the atmonarese. The mode of using either of these is the strotrh the glopes over a woolen hand of suitable siz, and then spone them with the Haich, removine the first or tirty portion with a seomb wash of clean haic]. by collecting the washimes S"prately, and allowing them to stand till the dirt Sctlos, the same turpentine or benzole may be used over and over ayain.

An innloroms composition may le made by dissolving one part of soap-sharing in two purts of rain or distilled water, usimy heat to aill the solntion. 'lhis is improved by arding to it a small guatity of lifurer ammonia and any ordinary perfums It should be applien to the glove stretcheal on the stock ly rubling with a phece of flamel always in one direction.
loeskin and wash-leather glowes, when not very dirty, may be cheand dry by rubhing them when streteherl on a stock with a misture of tinely prweherel fuller's-earth and alom, then swecping off this powder with a brush, anel dusting with dry bran and whiting. If the ghoves are very dirty, they should be washed with the soap silution, then rubleat with phe-clay mixel with yellow oche or amber (aceorchurg to the shade required), made into a paster with ale or beer, then carcfully dried and chasted to remove the superthoms powder.

Glove Pouder, for cleaning glaves, is matle by carefully drying Castile soap, and then pounding it in a murtar; or of pipe-clay eoloured with yellow ochre or Irish slate, or it may be made of a mixture of perelay and powderect soid.
qLuVES (in Law). It is an old enstom in Fingland on a maiden assize-i. $e_{\text {. }}$ an assize on which there is $n o$ offender to be tried-for the sheriff to prosent the juture with a pair of white gloves. The clerk of assize and the judges' oflicers have money given to them on the same oceasion, which is callet glore silyer. The enstom of presenting white gloves to the jultes on a maden cireuit is also observed in s.cotlamel.

GLOW'WORM, the name given to the wingless females of certain coleopterous insects of the family Lampyriche, remarkalle for the lmminosity of some of the last semments of the ablomen. The insects of the fanily Lampyrida have five joints in all the tersi, the antenne toothed, the elytra (wing-covers)at least of the males-covering the whole abdomen,

Cluwtrom (Lammuris noctiluca):
1, male ; 2 female.
the whale hody soft and the elytia flexible, the females often lestitute buth of wings and elytra, the thomx projection wer and almost concealing the heat. When seized, they llace their feet and antemax close to the berly, many of them also enving the almomen downward, and simulate death. The (ommon (r. (Lampmix noctiluca) is abundant in some parts of England, and rare in the soutlo of Sootland. The antenne are short. The male has very larie eyes. The female, which is larger than the maic, is fully half an inch in lenyth, of a hanckish colom, the legs dusky ret, and the thoras and alolomen marginel with that colour. 'She female is perfectly ilstitute both of wings and elytra. 'The habits of the insect are noeturnal. The male emits a faint light, the female a soft hat strong light, of which the use is suppused to be to attract and suile the male. The female $G$. is generally to be foumb, duing the summer months, among grass, or om mossy binks. There is reasun to think that the 9 . has the power of displaying and extinguishing its light at fleasure, so that it may not be
unnecessarily exposed to encmies; but if the luminous portion of the alolomen le remover, it rotains its luminosity for some time. If placed in liydrugen gas, it sometimes aletonates. 'The luminons matter is capable of beinir mixel with wator, and warm Water inereases its hrillianey. Two sputs on the last semment of the abromen are more lmminous than any other part, and a constant motion of this somment secms to be connected with the masnjon of the lipht. 'The two segments' next to this are each surrounded by a bund brighter than the rest of the segment. The larva of the ( r , is very similar to the prevect female insect, lat is very fantly luminous. It is very roricious, attackiner and fovouring suails, whereas the pertect insect eats little, and is supposed to prefer the tember leares of plants.-. Stereral species of ( x , are fomm in the wammer parts of biuppe, and in other parts of the work. "1he luminusity of the males of the geuns Lomphris, aul of other wingul insects of the family Lamplomete, has obtained for them the nanu. of Firetlies (is.v.).

GLUCClIO'V, a town in the south-west of Iamsia, in the revermment of Themigov, and $11: 2$ mitw in direet line east-north-east of the town of that name. It is surronoded by earthen walls, contains cight churches, has mantifetures of cloth, ant some trule in frain and limmly: In the veinity, foreelain ray is abtained, amb is sont muth to the iupurial manufatory at st l'etershurs. ['p. S5Jd.

GLUCI'NA (more comectly, Cincosa, from Gr. glyk!s, sweet). derives its mame from its salts havine is sweetish taste. It was liseorered by Vaupudim, in $179 \%$ in the monald, and has siuce been fouma in eynophane, chnysularyl, whenkite, the sadolinites, lencophane, and lelvine; but in consequence of the great lilliculty of preporing it, its properties and eombinations have not been much stnmied. Lerzulius reganded it as the sesquioxide of filucimm (q. b), in which case its formula wouk be ( $12^{2} \mathrm{O}_{3}$, lont it is now generaly belicedel to be a protoxide, (ill). For the mole of extracting it from the cmerill 1 or other mineral containing it, we mast refer tw Delray's Memuir on Ctucinum ant its Compounds (a traustition of which is given in the eighth yolume of the (hacrurly Journin of the chemeal Sorinty), or to any of the larger works in chemistry. Ghuina is a white, loosely eolherent pwater, with. out taste or smell. It is infusible, hat volatilises at a very ligh temperature.
Amonyst the salts of gluciun that have luen sturied by Drmay and oflers, we may mentim the sulphates of ghe ina, aut of glucina ant putash; the carthonates of slucina, anil if qucina and lutash; anl the oxalatis of gheina, of glucina iund lutiash, ambl of gheinat aml ammonia. They are chlomeless, aul miel rescmble these of aluminal:

The mineral thenthite is a pure salipate of qlacim. The hurelh, of which the emorcald is a variety, is at dumble silicate of shuciua and alumina. The nimeral cectuse is also a double silicate of the same carths: while the chrysumeryl is an :luminate of glucima, culoured with peroxile of irm.
GLECl'NOM (symble, (if), known also ns Gectsur, Glxema, and berybriem, is a factal
 Awhe jew from the analysis of sulphate of ghecina),
 mallealhe, and tusing whas the menturplomt in but in the first two sulstances it beemmes envered with a thin coat of oxide. It comlhines readily with chbrine, indine, and silicun. Even whin leated to reluess, it dous not decompuse water. It dissolves readily in bydroctaturiu and sulphuric
acils, and in a selution of potishlo luat is insoluble in ammmia, aul only slightly acted on ly nitris acid. It forms whe oxile, flictes.
From the rescarches of Dehray, it fallows that t? should be placed side by vile with almaninime Thest bodies are intermediatelateren the precions amm the ordinary metals, amd looth of them are charactarisel lay the following prynties: They are permanent in the air at high as wedl as at low tumpratures; do nite necumpese water, cyen when they are at a white heat; are mot attakend l,y sulphur, sulphuretted hydrowen, or the alkalin. sulphides: are not attackid hy ptrmy nitric ache at orimary tompratures, amil waly slowly, wen with the alld of heat: lut dissolve realily if dilute sulphuric and hydrochaturic acils.
(i. wats tirst nibtinad from gheinat loy Whater, in 1827, wher penen it hy deempesing the chlaride
 of glucina in lydurdherice arid. Dedray has sinco (15:3) oltaineal it mach more almidanty l,y applyng a similar mombe of proceling to that entioyed hy sumte (laire Peville for the reduction of aluminian.
(iLCCK, Inmax Cumisorit bos, a German musieal compliser, who may bo considered the father of the madern olnera, was bom, suly 2, 1714, at Wissenwanmen, in the Cryar follatimate. 110
 man solionls of Pragne, and as a wandering musician went th Vienal, where he fimal niphntunity to mater the rules of counterpoint ann harmomy. In 17:is, he weut to Italy, to complete lris musical ellusation, an! frund a worthy master in sanDlartini. After four yuars of study he wrote his first opera, Artoxecres, which wiss ferformed at

 in the two fullowing years, prontued at Milan and Turin. Having arhicved a ligh reputation, (6, was invitad to Lamon, where his Fall of the Giments was representert in 1745. Ho foum a furninative rival in Hambe, whase genius he henoured, am? he derivel great alyantages from the frimplyinp of Ir Arne, the English compner, and his laty, an excellent singery it was here that he hegan to develop the fall fore of that lyrio semins which was dastincal som to create a new order of musieal comprosition; but the onthreals of the leeleclion in Sootland closed the opera, the siugers and nusicians being mostly Rwana Catheliess and (f. returnew to Vienna. hat 10.5, he was vallel to Itome, where he

in a sinale phrase, when he calls him the Michael ${ }^{\text {' }}$ Amado af music.
(ail chentant, a town of Donmark, capital of the Iluchy of hulstein, is situated on the right lank of the Elhe, on the Kremper Marsh, $: 3$ miles bobs llambars. It is a petty town, mandarly hailt, and intorsected ley eanals. The chof huidelings

 of contaning ene ships, and firnished with wharls. The water watle which the town is suppliel reguines tole erathered intu cisterns and artilicially puratienl. Weaving is carricel on hore to some extent; lat trube, navigation, and whale-finhing employ the inhalitants chictry. $\&$ was fommed in 1600 by
 with sariuns commercial mivilures. Doring the Thirty lears' Thar, it succesfully withstucol thece sicues: its fontitications wero demolished in 151.5 It has hech a free purt since IS30. Ping. 61 for).

GI, UCOSE (ur, more correctly, (ilycose), known

 tinet, well-fomed crystals, hut may be obtainell in waty concretions, which, when examinal under the micruscone, are found to consist of minute rhombic talhets. It newer, however, erystallises realily. It is less sweet than ordinary (eane) sugar, is suluble in watur ant in dilute aleohol, and its solutions rotate the phane of polarisation from leit to right, this effect on a ray of polarised light leeing nowe markel than with cane sugar. At $212^{\circ}$, it fuses, and loses its water of erystallisation, ami at a higher temperature (ahnot $400^{\circ}$ ) it melergoes change loses the dements of water, and lecomes converted into (ceromel ( $\mathrm{C}_{12} \mathrm{HI}_{3} \mathrm{O}_{3}$ ), a hrown sulstance, which is neither sweet nor capable of underging furmentation, but which is reatily soluble in water, and is much used by conks anel confectioners as a colouring matter. At a still higher temperature, it heomes ratirely lecompesed into carbmic oxide, carbmic acil, light carburetted hydrugen ( ${ }^{\prime}{ }_{2} 1 I_{4}$ ), acetic achil, alhehyde furfurn, and a very litter sulnstance, to Which the name Assemer has been applied.

With hases, efneose forms various delinite lout unstable compounds, which have loen termed succhomes, a term which onght to have been restricten to the salts of saccharic acid. On heatins an alkaline solution of glucose, decomposition coisucs, aul a rark-hwon uncrystallisable sulstance is fommen, which possesses acil pronerties, and is known as meltossie net?. This reaction is sumetimess amplryed for the detection of glucose, and is known as Hemores test.

Glucuse has a strone relucing power, amb upon this property several of its tests are based. It roluces the axide of copper, even without the aid of heat, in alkaline solutions to the state of the yellow sub. uxile, and this reaction is apparent when unly OUOH of ghense is present in the dhaik. This is known as 'Trommer's test, aud Felling's monde of determining gheose fuantitatively is hasel on the same reaction. In comsequence of this reducing power, surar is sometines employed in the solution of the silver salts nsed for the silvering of mirrors.
dilncose seadily midergoes fermentation. On mixing a suntion of it, kept at a moderate temperature. with yeast, each equivalent of it breaks al, into two elpuivalents of alcohol, and four equivalents of carbmic acil, or-

$$

Thice the inthenee of uther cxciters of furmentation,
as, for instanec, putrid animal membrancs, or other nitrogemps sulstances, theose becones converted first intor lactie aud, and sulsequently into lontyrie acill. These reactions are cexhilited in the two following formule:

Trmber certain eomitians, which are mot accurately known, sulutions of ghense anderen a change which is termed risenus fermentation. 'The sugar becomes comsertal into a viscous ur ropy sulstance, while lutic arid and mannite ( $\left(1,12^{H_{11}} \|_{12}\right.$ ) are formed. This kind of fermentation swmetimes ocenrs in lishtbodied white wines. Wattr is probahly lecomposed, and its hydrogen unites with a phrtion of the ghnowe to fom mamite.
(blucose is a cunstituent of the jnice of grapes, phans, churrics, fiss, and many wher sweet fruits, and nay often be oliserved in a crystalline form on raisins, itried firs, \&e. It likowise ocenrs in honey. In the ammal kingdom, it is fonnd sometimes as in normal and sometimes a pathological eonstituent of varions thuids and tissues. Thus, it necurs normally in the contents of the small intestine, and in the clyyle after the nse of amylaccons and saccharine food, in the blowd of the hejatic veins (see Liver), in the tissue of tho liver, in looth the yolk and white of hirds' egess, in the urinary secretion in minute quantity (acourding to Briicke, Bunce Jones, and others), de; while in the disease known as diabctes, it exists in lare quantity in the winary secretion, and may be detected in nearly all the dluids of the body. By injuring a cortain part of the medula ohmmgata (the part of the sjinat cord containecl within the cavity of the cranium), an artiticial diabetes can be producel.

The mode of furmation of glacose, whether in the laluratory or in the organisms of plants and animals, requires some notice. It can be obtained chemieally from starch and from dextrine by boiling them with dilute sulphuric acial, or by the action of Diastase (c). r), and from cellulose and gum, and from most of the varieties of sugar, hy treatment with dilute acils. In the liver, it is formel from the dyeogen (II.. ) which ocenrs in that organ, muler the influence of a furment which has been chemically scparated frum the hepratic tissure, but with the bature of which we are not acquainter ; while in the rest of the ureanism it is tomed from the starch which is taken with the food, the starch undergoing this transfonnation under the intlucnce of pityaline (a forment occurring in the salion) pancreatine (a ferment occuring in the pancreatic juice), and an unknown lat corresponding ferment existing in the intestinal fluid.
The simplest methol of preparing mare gheose is by treating honey with cold rectified spirit, which extracts the uncrystallisathe sugar; the residue is dissolved in water, and the solntion is lecolorised with anmal charcoal, and allowed to erystallise.
It is manufactured on a large scale, especially on the continent, from starch. A mixture of starch and water at a temperature of alwat 180 is made to flow gradually into a vat containing water acidulated with I per cent. of sulphuric acid, and kept at the boing-pwint. In alwot half an hour, the starch is converted intos sugar. The limuid is drawn wff, and the sulphuric acid is neatralised ly the gradual adition of chalk, till there is no longer any effervescence. The sulphate of lime is deposited, and the clear andeous solution, after being enneentrated ly evaporation, is set aside to crystallise. The molasses is drained oft", and the sugar is dricel at a geatle heat in a current of air. "The
chicf use, says lor Muspratt, in his (hemistry Appliad to X ifs amel Mhemfartares, 'to which glacose is aphlied on the contiment, is for the mannfacture of bere and a conase libul of alcolmol, which is sail to be extemsively comverted intor limeneh lnamly by the aldition of oil of rasins, colvomb matter, \&e.
As all alcoholie mrinks (akes, wince, aml spirits) are ubtanuid from thinds embaning this batioty of surur as the essential constituent, and at thour quality manly dopends mpen the amome of suwar that is presciat, it is very inpurtant to have some realy means of detominime tos amont. A similar Wetermination is alsn of great vahue in referenee to the urinary secretime in dian tus, an it is manly ly ase ertaining whe ther the dialy anomat of extretil ghense is diminishins or mereminis that wo can trace the favourable of unlavomahle procres of the calse.

Without enterins intes Actails, we may montim that there are three lifferent mondes of deteminine the amonat of ghorese in a thain: the first is lig determinine the specitic sravity; the secoml is the optical test, which is based minen the fuet falmaly noticed), that solutime of sugur (wh ther wran", canc, or milk surar) exert right-handed rotatiou uron at raty of phlarised light, the angle of rotation hemp propurtional to the pereanture of susar. Sulenh's propatus fur deterniming shan in this way is
 The third is by chemicil means, wf which the nowst important are Pameswil's method and the fermentation test. Barreswil's methonl is havel unn the property which elnense $\mathrm{p}^{\text {wissesses }}$ of thruwing down suhoxile of edper from alkaline solutions of oxide of erpler.
In emphying the promets of the fermentation of gherse as a meams of detuminine its quantity, we take a given quantity of the saceliarime thand, ahm a little well-washed yeast, aml colloct the carbmic aciel that is evolved over meremy, langhy spakfang, a culvic hath of carbonic acit corresponds to a grain of sugar.
Much infomation urnin the rifferent tests for
 will be fombla in paper recently phashed liy In bumee onves in the flumterly Jomonal of the

 Mollitus (see Dinbervas), and indicative of its char. acteristic symptom, the presence of sugar in the wrine.

surface of shallow stacnant water, place site ly side, united hy an unctums matter, and instened to the botom $1, y$ a thewl, whing pevents their foating away. They are soon hatched; indeed, a single smmare secs several generations of grats. The larve are t, be sem in immense mombers in stas. nant waters; they are of an elomatel worm-like form: are lestitute of feet, lont swim and dive hy means of fin-like organs; they feed on insects, anil also on regetable sulistances; aml often snspemi themselves at the surface of the water, head downwards, for the purpuse of respration. by means of radiatine bristles attachend to a lones spiracle or tabe at the caudal extremity of the body, ly which air is
800
admitted to the trochere or air-tulres. The pupar also inlabit water, ind are active; they remain almont constantly at the surface of the water, with the bouly recurved : and the respiratory opmones of the air-tulnes are now in the thorax. -The Combos (. ( (! piparms) is of very whle rearmphe distribution. It is abont there lines in lenorth. lawon, with whitish rines on the ablemen, the winus maspretted. It so abounds in some of the fomy parts of Enfland that beds are oecasionally surrombled with wanke cur. tains, as in ludia on aceount of mospuitoes. It is extremely abmustant in Lapland amb Icelamb. A number of [-hera. allige to cufor, are united by many entomblorists into a family called C'ulcider.

GYEIss, a term introducel from the German, as the nime for a variety of Detammphie roch, whiel has the same compument materials as granite, and differs from it only in these materials locing arranged in layers, mather than in an apparently confused aquregaten mass. The minerals of which it is compused are puartz, felspar, and mica. The mica is sometimes replaced by lomblende, proHucing a enneiss eorresponling tus the variety of manite called symite. The difterent ineredients vocur in various moportions, alterinc the character and appearance of the gneiss accordingly. It is often difficult torletrmine haud specimens of gneiss; for, on the one hand, they are sometimes so crystallime that they resemble sranite, while, un the other, the schistose varicties approach so near to micaschist, that even in the fiell, woler the most favomable circumstances, it is aot easy positively to soprate then.

Gineiss was originally deposited as sand or mond, ant las boen converted into a hard tough orystalline rock ly loner and eontinuous subjection to metamondric action, inducer, 1 mornap, ehietly by heat. It has gencrally heen considered as an azoic rock, that is, leposited lufore the existence of life on the alohe. The oller strata, classifted by Losan under the title Lancontinn, the equivalents of which have been recently aloweri by Murhison in Sootlaut, have as yet moved clestitute of fossils, but this may be owing to the extreme metanorphism they have mulerente. "The Ciambrian and silurian strata of the north of sentland late also been to a lirge extent converterl into senmissose rocks, which contain interealated witl theren fossiliferous limestomes. It would serm, indeerl, that gmeiss and its allicel stratificd rocks are not necessarily ' 1 rimary rocks," lout may ocour wherever an agency sutficiently powerful has acted nom ardinary samdstone anil shale.

GNESEN, a small town of Prussia, is situated in a district abomminis in hills and lakes, in the worince of I'osem, imd thirty miles east-northcast of the town uf that namme. It was the curliest capital, and is said to be the oldest town of Poland. I'un. 770 a.

We have stated at the ontset, that Gnosticism was but a gencral name for a great number of diverging Chrestian schools. But all these had some fumlamental pmints in common, which we will attempt to sureity laciefly, as far as the fragmentary and allultorated nature of the evidence will permit ; for tuluckily, all we know of the (t., we know from their , lewish and Cllistian alsersaries. who confessudy took especial pride in representing them and ther lichef in their darkest hues.

There is a Divine Being, whose essence is love, srace, and mercy. He is enthronel in the highest Leight, cnelused in an alyss (Buthos). He is the sum of being, the is silence, ahstraction, ineomprehensible, for haman mands almost non-existing (Ouk On). The Nosaic Cosmurghy has ant seemingly, they said, hrought us one step nearer to the sulution of the problem of the ereation. Out of nothing, nothing can come, notwithstanling a Divine Fiat; for find can, through his spiritual nature, have no connection whatever with curporeal things, and he could ant bave originally male them. 'They, therefore, assumed a pre-existing matler ( $I_{y} / \mathrm{l}_{\text {l }}$ ), out of which the miverse was merely formed. A corroluration for this opiuion was foinul-according to the peculiar Gnostic male of interpretation-in the two aljectives Tolu robohu (without form and roid) (Gen. i. 2), applied to the earth, and which were by them interpreted as substantives (Kenoma, Kenom) intended to express the original substance of the universe ('l'f. (ien. Rab. i.). Between this Hyle, or visible wurld, however, which was either rejuesented as the darkness on shalnw alongside the disine light, as a shughish, stagnant mass, or as a turbulent, active kiaglom of evil; and that supreme incomprelatasible Being, whose goulnoss could have nothing to do with the evils of the work, no more than his perfection with its defects aud missry, there existed a Pleromu, or fulness of Linht. In this fulness dwelt emboried attributes of livinity, the abstract ideas of Wistom, Justice, Right, Iower, Truth, I'tace, amd many more which had emmated or thowed ont (in fairs, as some ledn. male and female) from the supreme central pint, as rays innmerable flow out of the sun, as comotless numbers from one unit, as echoes from a sumal, or as, pimarily, all the fonts and rivers arise from the waters below. At the head of these emanations or Eons (Everlasting ones-hke their source) which, descending lower and lower, form a link between hearen and earth, stands the Nons; and one of the lowest Eons is the Demireryos. Ife is the real framer aml master of the visible worll, aml partakes to a certain degree of its nature. On the nature of this Demiurgos (Jaldabaoth. Arehon), bowever, the two principal divisions of Gnosticism, which might be termed Jutao-Alexandrine ant Syrian respectively, widely differed. The former terds him as the representative and oryan of the lighest frud. It was he who hail been put by the divine will over Isracl, especially under the name of lehorah. As other, though inferior, angels presidel over the destinies of other nations, so this ligher Ann had to protect the peculiar people of Giol. It was he, therefore, who rerealed himselfhe who gave the laws-he who sent the prophets. Ent in all this he acted rather as an unconscions metium; he was no more able to comprehend the full meaning of the iteas revealed through bim in the Ohd Testament, than he understool the scope and significance of the ereation. His principal attributes are justice and severity, which, earricel wat with stera consistency, become cruelty. Thuse G. distinguished also among the Jews themsclves, thise 'ufter the flesh' who, confounding the likeness with the orignal, the symbol with the idea, took
the Demiurgos to be the surreme God, and those 'after the Spirit,' or Israelites indeed-the privileged few who, divining at least the veiled ideas of the supreme Coml, needul no such education by fear or hope: punishment or reward, at the hands of the Demiurgos, but rose alowe him in understanding and conception of things human and divine. The other principal party of the G., bowever, the syrian, under the intuence of the Parsic (Zoroastrian) Dualism, so far from convidering the Demiurgos as an instrument of disinity, whlling but poor in intellect. looked ulon him rather as a rival, and consequently contlicting power. He is the primary evil opposed to the promary good. The clive germs which, according to both parties, had been commanicated through the lowest emanations in their downward course to matter and to mankind, the Demiurgos of the Alexandrians had not known how to develop in a proper manner, but had weakened, soruetimes neutralised them from want of koowledge, thus engendering all carthy sin and misery against his will. while the Syrian Demiurge spitefully and maliciously stifled these germs in orler to wrest the pwwer over the world from the Divine Being altngether. His base, revengeful, and withal limited nature, they said, is fully and elearly stamped upon the Uld Testament-exclusively his work.

Man-in this all the schools were agreed-was diviled into three classes, correspunding more or less to these predominant powers of the world: Divinity, Matter, and Demiurgos. There were tirst the spinitnal men or Pneumatikoi, inspired by the highest five, striving towards him. with him; initiated into his comsels, understanding his essence. They were free from the yoke of law, for terrestrial natire hal no power wiver them; they were the prophets, guiding, but not quided ; the possessnrs of the true Cinesis. Dianctrically oplosed to these, as was Hyle to divimty, are the terestrial men, Sarkikoi or Chovk-of the earth earthy-who are tied and boum hy matter; they can ueither aspire to the heinht of spiritual men, nor are they to he ruled hy the precepts of law. Between these stand the Prigetion, the hind servants of the lawgiving Demiurens, who are, throngh the restraints put upon them ley his cither stupinl or spiteful precepts, free to a certan degree from the terrestrial powers, lont they can nover reach the height in which the memnatics halntually iwell. And arain, correspmoling to these three classes of men, there were thre princinal rclicions; Christianity above, Heathenism velow, Julaism in the intermediate space.

The two leading tundencies of Gnosticism, of which we have spoken, also manifested themselves, accordingly, in the view they each took of the person of Christ himself. According to both, he was the highest Eon, smidenly sent down by the supreme Being, to rescue and rechaim certain higher natures - for the lowest stratum of men, the carnal or terrestrial, was irrerleemably lost-whieh had either been led astray ly the Demiurgos, or had become entangled in the net of matter. At the same time the hamonious combination of the human and divine in Christ, which the Jew Testament assumed, stool in direct opmsition to the rery hasis of Gnusticism. The Vivible and the Invisible, the Finite and the Infinite, Gol and Man, cannot combine: in this they all agreed. But while the Judaising schools divided Christ into two distinct persons, one of heaven and one of earth, who hall only become one at the baptism in the Jomlan, and who hal separated at the erncifixion; the other oriental section of Gnostics beld that Clurist's earkly manifestation in the flesh,
that his whole humanty, was a mere shalow or delusion.

It misht well be asked how, with this extraordinary conglomeration of Domonthism, l'antheism, Spintualism and Matcrialism, the (s. walle fussibly take their stand on the binle, which, from tint to last, it would spem, donombers, and in the strongest manner, foctrines such as the: furesoing. The only answer to this is, that therg, and they only. were the l'nemmatikoi the luitiater. It was well for the other partions of mankim, the matural nem, to take everything, incluling feripure, and ita Listorical as well as its dommatio! ! farts, harally: As in ereation, so in the lank; the (i., guidme by their inmer lights, sate lementh the surface, amel saw everywhere, the most momple allirmation of

 all Thend. iii. 6, de.).
Practically, Gousticism inftenced the lives of its adherents in two tutally distinet ways: acoording tu the riew thoy took of the mature and oflice of the Hyle and lemiurgos. The It llemising Gnostics, striving to free themedres as much as in them lay from their sturid aud dograding bomds, beame aseetics, anstere, rigil, and uncommomismg. The orieutal view, howerer, of the dualistic and antagonistic lowers of light amp darkness, gool ant evil, which was alonted ly the wher portion of the G ., led them, on the other hanl, to the practice of the grossest sensuality, in token, they sail, uf their utter contempt for matter, and still more for the Demiurgos-limly, and its enjoyments; "rerything torrestrial, in short, had as little to do with theire minh, which was one with the suprome Deity, as hal matter with Gonl. Transcression there was none, because there was no law; there could 1re no lat for them who were better evon than the angels--who were subject to none: a disturtion of a dictum in the Miaresh, that 'the law was not given to angels, lut to mortal men, and was therefore to be alministeral I niently.

made ul of parts of different animals, not only of the ant lope ame the wis onflib, lint even of the horse. This spreics (C. Gitur (or Antope Gum) is a native of sonth Africa; it has disapleared from the more sottlem parts of ('ipe Colony, but is to be seen in lereds on the aril plains logomit these bmantatios in company with the zelma or the quagga, and with tlocks of istriches. The form and action of gous
so mach resemble those of zchoras and quargas, that at a ristance they may be realily mistaken for them. The size of the enn is that of a large ass; the emeral colnme is yedlowish tawny. Ibth suxis liave homs. The limlis are shemer, like those of theer amilatelnes. The gmu gallons with great sped. It has been nanally represented as a very fiere animal, and certanly shews moch ability to defend itsedf with its homs, when mable to eseape from tancer by flight ; but when taken young, it is easily tamed, aml readily associates with oxen, accompanyint them to and from the held. There are two or three spocies, all sonth Aerican, nearly resembling the conmon gm, and one of them at least is very consilerahly larger. Their flesh is sain to be pralatable.
(iod, a city of Hinchastan, on the Malalme coast, in lat. $15^{\circ}: 0^{\prime \prime}$ N. ant long. $7 t^{\circ} \mathrm{E}$, while the depoment tertitory of the same name stretches in N. lat. from 14 . $54^{\prime}$ to $1.14^{\prime \prime}$, and in J. long. from
 $31 ; 0.2$ inhahitants. (t. was once the capital of the Portuguese duminions in India, hut is now in a state of hopeless decay. It was raluable chiefly on accome of its harbour, one of the lest on the west cuast of Hindustam, from which it was about 5 miles distant; but having the misfortume to be ravared ly the chalera in the logiming of the lsthe e, moist of the loutngucse lift it, and setuled nearer the sea, at Manion or New Goa, which is the present seat of government, with a popmlation of about lo,(wo). The inhalitants of the ull city are almust entirely celesiastics, the place luing the see of an arelinishop, the primate of the Portuntese Inties. (i, was conqued by
 by an Aralut peope.

GOALPA'RA, a histriet of Imlia which belongs
 Assam, stretches in Nat. from es $4^{4 \prime}$ to $-6^{\circ} 3 \mathbf{I}^{\prime}$, and in E. lons. from 80 4. to ! $11 \mathrm{~S}^{\prime}$. contaning :540 siduare miles, anl alront thomotimlalitants. On the N. it is lummend ly the native state of Thontan. Its calnitil, of its own name, stauds on the river limanaputra, in lat. $26^{\circ} S^{\prime} \mathrm{N}$., and long. (t) $40^{\prime} \mathrm{E}$.
(GOAT (ctqmet), agenus of riminant quadrupeds of the family ' 'opmite ( q . . .), su clusely allien to the theep that it is not easy exactly to detine the distinction, although tle common domestic goat and huep are of willely different alpwance. One of the mest marken of the distinguishing characters is, that the homs of grats are directed upwards, hackwards, and omtwaris, whilst those of sheep are more in less spirally twistech. Another eharacter is the beand on the clin of the male goats, which is wanting in the sheep; lint these characters are ant perfectly constant. Perhaps a more constant character is the straight line of the face in goats, as comparel with the arched line in sheep, The tail of grats is also much sharter than that of sheep. I curins lout enustant mark of distinction is the wint of a small jit, producing a fatty secretion le'tween the toes, in grats, which exists in sheep, and is peenliar to them. And another constant mark is the stroug smoll of male seats, particularly during the rutting seasom, which is wanting in sheep. Equally constant are the differences of temper and manners, gats being in a high clegree curions and contident, and the very term crpricious referring to their exhibition of the quality which it denotes. In both goats anl sheep, botb sexes are usually furnished with homs, the want of which is a varration apparently caused ly domestication, and is most frequent in females. The lorns and beard

GO.NT-MOTH (Cosests liynizurder), a lebidopterons fuscet of the same family with the (ilurstmoth, I/piulidte: The fomus Cusitus has long antemase; al lame lorly, a rory small heal: the "per wings larger and longe than the lower. 'lhe larsat foed on the whend af trees, amt the birbat are enclosed in cocoons mate chiefly of the saw-last which the mandildes of the lartie have prodaced. The (i. is one of the larocst of British
 to tip of its expanded winge. It is of a gray
ehomm, the nyper wings motled with white, and makded with many irregular black liues, the lower wings of an alnost unifom lownish ash colonr.

The larra is about 3 incles long when full grown, yellowish, the upper parts pink, the head black. The larva inhalits and feels on the wood of willows, pullars, and elms, making holes large enough to adinit the finger, and often cansing the destruetion of trees. It emits, when alarmed or hamded, a peculiar and disaqreable goat-like odour, which camot le removed from the hands even by frecuent washinge

## GOAT's-BEARD. See Shlsafy.

GOAT"S RUE (Cutefre), a genus of plants of the natural order Laquminost, sub-onter Papilionace⿻, of which one species ( $t$. aftirimalis), a peremial herbaceous phant, about three feet in height, with piunate leaves. lons pointel luallets, racemes of generally $1^{m r}$ hish or pimk-eflouren flowers, and ouright nearly cylintrical pols, has been recommented for cultivation in Fitain as a forage plat, on acconnt of the ereat buik of produce which it yields. It has, however, a peenliar smell, and is not relisbel loy cattle maceustomed to it. It is a mative of the sonth of Emrope.

GOA'TSUCKER (Cteprimulgus), a genus of linds
 mandible curvel at the foint, and firmished along each margin with a row of strong hairs or hristle's (cilriswe) directed forwards; the hind twe eabahle of being dirceted forwards; the claws shont, except that of the widhle toe, which is remarkably lone. tanl sermated on its immer eige, so as to form a kimi "f comb attachend to the toe. Althurgh the bill is very short and weak, the gape is extremely wiele, as if the heal itself were diviled. The enatsuckers feed on insects, perhaps chiefly on moths, whence they are cadled Mollh-haters, and parsue their frey either in the evening twilight or during the night, in a manner similar to lats and swallows. Like them, they seem to contine themsclves rery much to a limited space, in which they uften pass amb relass at no great height ahme the grouma. They have great lapidity and power of flight. Of course, their great width of gape is favomrable for the captrare of insects. Gruatsuckers are binds of light, soft $\mathrm{p}^{\text {lumage, in general minutely }}$ mottled with gray and brown. One species alone is foud in Britain, the Commos G. or Eefopels 846
G. (C. Europaus), also called the Night-Churr, or Night-Jar, from the sumud which it produces; and not unfregnently, from the resomblanee of its mumage to that of nols, the Ciffin Owi or Fern OWL It is a summer visitant of britain, coming wey late, and departing generally very early; it is more common in Englaud than in Scotkud, althongh its migrations extend northward to Scandimavia, Siberia, and Kamtelatka. In winter, it retires from Europe altogether, passing to the south of the Mediterranean. It often hamuts lushy places anl grounds cowreal with brake. It scarcely makes a nest, but heposits two cergs in a depression of the grouncl, under shelter of a hush. Its whole dength is about ten inelies and a half. This hird is the Cammimulns of l'liny, the Aigothoters of Aristotle, both these names lieing exactly equivalent to the English (i., and expressive of the ancient and long entertained popular notion, that this bird sucks the teats of guats, a notion probably fonuded on the habit-which, at all events, has been

Common Goatsucker (Caprimulyus Lumopacus).
ohserved in some of this family--of hunting insects muler the bellies of grazing cattle.-species of this and closely allied genera are very widely distributed over the world.

GOBBE, or VOANTZOU (J'uendziat subturanca), an anunal plant, allicd to the kiducy-bean, but of which the pool is thrust into the ground in the same mamer as that of the Ground-nat (Arachis huporect, see Arachis), to ripen the sceds there. It is a native of the north-east of South America, anl of some parts of the west of Africa. Its sceds are used as food, being wholesone and agreeable when boiled.

GO'beo, golilio. or gombo. See Mibiscus.
góbelins. See Tapestry:

## GOBI, Desert of See Shamo.

GOBLINS AND BOGLES, familiar demons of popular sumerstition, in Fr. gobelin, Ger. Rodold, dir. kobalos, is spirit which lurks about henses. It is also called hobgoblin, perhaps a corruption of hopgolhin. Some have derived the word goblin from the French ${ }^{\prime}$ fler, to swallow, to devour; and others the worls elf and gollin from the Guelphs and Ghibellines, ewh name being used by the other party as a name of teror. Collin is used in a serions sense by Sliakspeare in Jicmlet, where the shost is supposed to be a 'spirit of health or gobling "danned.' Gobelt, in French, is aplied to juggler's tricks and iustruments, and our word goblet comes from the juggler's cup.

Bogle, bogle-boe, or lngalioo, may be from the Wielsh broymb, to termify; and boe or boo, a sound. Bugaloo was the popmar name of wide-monthed, ugly lictures, forme:ly carried in May-games. Warton
says Boh was the desiqnation of at fieree Gothic elhieftain, whase nune wats nseal in after-times to frizhten chilluen. The bedief in bencualent and maiesolent spints belongs to all countries, and a 1 prase to he as old as the worll.
(iolionk in Henallry, the same as Compone (1. ©.). A wobmated londare is frequently carried in flace of the baton sinister, mot only by the lawful ismae of bastarls. Who, after the thard lawful gencration, are consinderal entitled to make the ehange, bat by lastaris themselves. Sece bistaro Bati.

GOBY (Gobins). a genus of acanthopterons finhes, The: tye of the fianily Gounhore. This fammly is distinguished by the thinness and hexibilaty of the rays of the florsal tin; ly the minn-in most of the gencra-uf the rentral fins, whichare thoracie, into a dise more or less capable of locion useal ats at sucker; by the want of an air-Wmetder, and hy a long intestinal canal without eaca. The Blemny (q. v.) family (Btrmielu) have hev some in hithyolngists been mited with the Cobly famuly, whulst uthers unite wath them the Diserluli (I) ©.). The true golbes (foblins) are generally smath tishes, smme of them inhabiting the shathow water of the comants. and others fond in deepre water: the species vory munerons, and fomm in the seas thith of the motherin and sunthern hemisphares. They are very inters esting on accomit of their hahits; and aro of the mamber of nest lailding fishes, cmploying deyse ant grass-wrack (Komore merine), in the sprines season, for making their nests. When the fonate has depositell her "wrs in the nest, the male watches wer then till thry are batchen. There are several ['ritish speeies, the largest of them-the Black fory

The liack (bingy mat the Une-spotted (ioly (s'oblus niger and (ribius uniphmetetus).
(f. niyn)-about five or six inches long. some of them pretty common on all phrts of the coast, and mach in request for aquatia, of which they are annong the most internsting recupants. They are ofter foum in rickepuls on the cenat. The dise formed by the ventral tius is often used for andersinn to stones. Dust of the erolhes profer seats of dayey or maddy latema, in which they excavate camals to pass the winter in. The species are mone numermas in the Minhterranean than in the lintish seas-
 several other interesting fencha, anomy whin are the boleondhutmi of the "hinese neas, remakable for their jower of thrasting mit than eyes in orter to look armund them.

GO1) (lat. Jert: : (ir. Theors), the arifexisteut and Suproue Being, creator and prescrver of all things, and the ebject of haman worship. The name is of Saxom origin. The dera is more or less detinitely expressel in every lampase, as it may be satia to be in some form or another a mid. versal element of the haman consciousness. There have been many mations, iodecd, in every age of
the world, that have been far from attaining any such ernception of God as is expressed ahove. The Sulpeme has becn to them the couception not of a single lseing, lont of many beinfs superior to man, and elaming his worship. In the general history of the workI, polytheism irecedes monotheism; the ifler of many gods gues hefore the inlea of one God, inlinite and self-existeut.
The genmal character of poly theism is everywhero the same. - A dualistie conception of mature and life unlerlies it, anl slews itself in varien cxpres. sions. In looking forth on nature -in lonking within himself-man seems to see two principles striving for the mastery-an active and passive, a creative and recipinnt primeiple-it gend and evil, a proluctive and destructive, a joyous and gloomy agent. On HIL side, there secms a power rich, heniomant, and gracians, giving light to the day, verdire to the spring, abmatace in athom, seattoring fectundity amblessing aroum! ; the other side, there seems a luwer erich and malerolent, quenchng the lyht in darkuess, consuming the verdure and fertility with scorching hate or destroying them with end. These contrasts sem eternal-they take pusnession of the imasination, and clothe thenselves in diverso shapes. Luevery polytheistic righem, they will be funnd in the recogution of mate and femake, "f poud and eril divinities-Balal and liaaltis, liaal-Adonis and hat-Anhoch, in the ohl Phamelian religon; Osiris and lais and the eval printiple, Typhon, in Eenpt : and the more familar apmosites of Ahriman and Urmuzd, Jupher and Jump, de. The dubhem assumes varions shapes, now male and fenale, productive ame basme ; and now good and evil, conservative and destructive.

Whether this cluahstic mode of enneeltion, and tho polytheistie viow of nature that springs from it, ho a later or an earlier type of thought than the monotheistic, has beem at geneldeal disputed. Some see in it the esrmption of monthethem-the worshap of the supreuse grombally fallug to a worship of the great forms of nature which most strikingy represent llim-the sum and storm, the light inh durkness, \&e. Others, again, regard the phlythestic as the primitive view of nature, alove which man gralually rises, by the growthand exereise of his reason. There is trith in thin latter view, cren to those who belueve that man orginally receiven a Divine lievelation, wheh he has grahnally compuped. Pulytheism is the natural religion of sarage trabes thromphout the worlal; and as man atvances in civilisation, he rises to purer and more emprehensive ancep. tions of Deity. Llis reason comulels him to reergnise the One in the many werywhere, to carry up all his conceptimus ints a unity, Dolytheism, conserpurntly, "rery where disapheas lufore the march of civilssition. It is incompatill wath the luwest stage of spendative derdepment.
but. while the rrwwh of reason and tle rise of sueculation everywhere destrey polytheism, they do nat necessarily subntitute a gemuine moncthersm -the doctrine, that is to say. of one loving and trace (ind, inlinite in power, wistum, ghombers, and truth, a free persmal being exalted abow the word, and apart from it, get intimately related to all its ereatures, who 'sublereth mot it sparrow to fisll to the gromed withut his furmasim.' This is the doetrine of Chmatian theism, as ollystad ahke to polytheism (the doctrine of many youls), patheism (the doctrine that all thing are (mond; that fard is a unity, yet only a unity of emmphession, unt a self-sulosistant and indemment umty), and atheism (the assertion that there is bu (fort).

The course of argument on which the theistic conclusion supports itseli may be sketched as follows: There are everyhlore in the world the traces

## GOD-GOD SAVE THE KINC: (OR QUEFN).

of nomer; a unity of plan or design, shewn in many beantifnl effeets, pervates cration. seience is alwars mere unfolding it. Of the fiet of this order wr unity of plam, there is un questim. The procress

 What appeared $t_{0}$ le the result of upposime principles, is really found to he the isswe of rseneral laws working om shac orat althong mexplencal selmme of hammony. Theree is mo disturlmance, wo flisunf: : amilst the intinite diversity of nature -ambormens miversally.

Fht this "urder, what is it? 'The move recognitinn of order does mot ancessarily inply the reconinitim of God- of a beinif all-powerful, wise, and soml, by whom everythinir exists." The materialist and paintheist equally mimit the fact of order, lut equatly aleny the theistice comelnsion fumbled upon it : and the arrument, acemolingly, is carrien ab from nature amt its facts to a higher region of elischssion. Whente arises the emereption of order uf desion? Nature illustrates it, but nature does not itself give it. The anneral laws of which science speaksso muell prowle all phenomena of ereation. the thes are not a part of these phemomena. 'Orater' anm law are inleas which we convey to matme, not wheh natme lrings to ans. They come from within, not from witlout. It is with mink, and not with matter that we start, Jhe latter in itself presents a unere series of endluss movements. It is in the prather of mind only that it assmmes meaning and ordor: Nind is the true image of the Deity. We diseern comention in mature. lecense we muselres are regrons, conscmons of exprting power. De discem orter in nature, hecanse we ererywhere brins our conceltions intos a unty, and aprohemd onr seresal modes of conseinusness with reterence to the indivisible self which they all inwolve. "In ane life alone does nature lise. "It is frone the little worlal of our who eonseionsmesa. with its many olijects marnhalleal in their array undor the dule "t the one eonscions mind, that we are led to the thought of the great miverse beyomi-that we comecive this also ass a woml of order, and as bring such by virtue of its relation to an ordering and fresiding mind.'

The rxistence of Jeity, therefore, is a postulate of the lnman conseionsuess. Recognise a living mind in man, interemident of matter-a rational urill, as constitutine the essential and distingushing chment of his heing-and the inference is inevitalile of an intinite mind-a supreme will grveming
 a true prschamogy, A philosophy which denies to man a ligher existence than hature, which wombl make his ratimal eonscinusness the mere srowth if saterial eonditions, leaves no gromml of argumment for the existence of Doity-fin as Jacobi says: "Nature rereals mily fatio, nuly an imlicsoluthe chain of eanses (smpeness), without begiming and withont ent, exthrling with equal nevessity looth fovidence amb ehance. Wrorking withont will, she talies comsel neither of the grond now of the beantiful; qrating mothing, she casts up from lou dark aboss only cternal transfomations of lacself, umemsciously and withont eul. Bat man reveels Godfor mam, hy his intelliqenee, rises alove mature, amt in virtue of this intellurnere, is conscions of himself, as a power not only ind"prurlut of, but ngrosed to, mature, and capalife of resistion, eonquoring, amb contrullius her. As man las a livines faith in this power suberior to nature, whinh dwells in him, su has he lelif in Gobl-a feeling, an reperience of his existence. As lue dres mot helieve in this power, sis dues he not believe in Gud; he sees, be experiences nonght in existene but nature, and nceessity, imul fite."
sus

The arcoment for the existence of Ged rests, aecordingly, on certain funlamental principles of our mentil and motal beion, such prineiples as cansation ant resign, on final canse. It imples a suritual philosuphy of hman natme. Apart from such a philosobly, theism has no argumentative basis, lowever it may ymeval as a tradition or superstition.
lat some philosompers have songlit mot marely to rest the argmment for the existence of foul umon sucli principles, but to evolve it in all its completeness from them alone. From a sincte clatinn of conseimususs-somutimes from a single datun of experience-they have tried to constrent, liy jro. ecoses of more abstract reasomians a 'ilemonstration of the heing and attributes of (rom.'. 'This has been styled the if prion $i$ method of aremment, although to all the argmonts to whicle this name has heen given it does not strictly apmly. The mole of argament, again, which reasons from special effects in nature to a First C'anse, has hecn styled, in contradistinction, d postcrioni. The argment from design. for example, as conducted ly l'aley and others, is it pesterion. 'The aromments of Descartes, and the "lemonstration' of 1)r Sammel Clarke, are what have heen tormed a priori. Either of these morles of prouf, taken ly itself, las been rightly considered inemelnsive by recent writers on matural theology. Nere a prowi trains of reasoning fail to earry up the mind to anyreal and living ronception of Deity; they yiell merely a theoretical or alostract ilea. Arguments subli as Jaley's and the lidelgewater treatises, again, are rather illustrations than arguments. They lurive all their lonical foree from certain juincipes which are impled in their details, and withont which these details cond have no hearing on the existence of Gonl. The very idea of Tosion itself is such a principle. It is the die which the mind stampsum mature ; it is loot in nature itself. Any complete aremment for the Being of (rind, therefore involves equally a priori and it pustrovore elements. The formery are necessary ats the rational fondation of the armment; the latter are nceessary to illustrate, to give life and body to the genevil primeiples which lie at the fumdation.

The Christian doctrine of the Gothead will he considered umber the several names of TriNity, Sov of Gois, met Joly Spirit.

GOD SAVF THE KING (or QU'EEN), the noble national antlum of (ireat Britain, ant by adoution that of Prussia and tle German states, and which is played and sung in every part of the British empire alike on sulemm and fustive oceasions, has leen it subject of controversy with respect to its migin. Its words are apparently imitated from the Domine Salvom of the C'atholic Church service. in England, the anthorship has heen gencrally attriluted to Ir , Joln BuII, forn I5 $0 \%$, in 1501 , organist in ()neen Elizatretlis ('hapel, 1500 , professor of music in Gresban Cobleqr, and damber-nusician of James 1. Alonat the gerion of the discovery of the Gunpowiter Plot, he eomposed and plaved on a smatl organ before the king an ote beginning with the Words, "God save great James ou" king.' He died at Jijheck, lowe. It does not appear, loweyer, that this, on any other ohl eomposition of a similar title, hat any connection with that whicls we now possess. Chaprill, in his Popnlme ansie of the Uhlen Time, and In Fink, a German musical antitinary, have settled the ruestion: the honour of this great Work, hoth words and melon?, must be given to Dr Jenry Carey, an English poet and musician, lown in London about 1696, dica 1743. The words anm unsic were conuposed in honour of a bithday

GODFRES OF BOHLLION, Duke of Tamer Lomaine, lum alout lail, at farisy, a vilhag of Belpian brabant, was the riblest sin of cimat

 Larraine and bundlon, whom he surcereleed in the
 with grat gallantry in the aimies of the banuror Themy IV., both in (iomany and toly : and it was from his ham! that the comperition fin the
 renthbow at the battle of Aleswhars. When the first "rusalio was set on font, the fanne wif liis "xploits canser him to lre elacted one of the prineipal commanders. $l_{n}$ woter to defray tha expenses of the rusad of 1095, le martemant
 panial ly his Imothers Lustare and Thatha, in the spring of lowi. Fir a detailel acomat of his careor un till the takine of Jorusalem, see ('matum. Eight days after the takine of dernsalen, 6: was proclaimed king lig the namamms rame of the crusarling army b lit the gicty and lumility of the compueron Forbaile him to wear a crown of golle where his Savion had wom one of thoms.' He deelinet the regal title, contenting himself with that
uf Defender and Guardian of the lloly Sepulche. The sultan of Eqyit, learning that the army of sum, etw Cruxalers who had taken Antioch hat dwindlod away to 20, oro, whanced against them with an army saill to have amonted to 400,000 men ; Int (: Lav" lim lattle in the plain of Asealom, and the victory gained an this oceasion put him in fussession of the whole of Palestine, a few fortifiod towns on! y excepted. He now directed his mmeavmurs to the urganisation of the new state: he installed a patriarch, fimmided two cathedral chapters, huilt a monastery in the valley of Jehoshaphat, amd drew up lavs. Jle died in 1100 , and his body was interred on Mome Calvary, near the Inly sopulchre. History represents this prince as a monlel of piety, valour, and all kingly virtues : and has praises have been worthily sung by Tasso in his Jernsintent Delivered.
(a)DOA, Lame batroness of Cosentry About the year 10t0, Leofrie, Earl of Mercia, and Lord of Coventry, then an important market-town, imposed artain onernas services and heary exactions mon the mhalitants, of which they lumlly complainet. lifs wife, the Lady (a, having the welfare of the thwn at leart, lesimght her husham to give them relief, and was sor camest in her contreaties, that at lemath, to escape from her importnaities, the carl said he whal grant her the favour, lut only "n combition that she would ride naked through the town, suphering, from the molesty of lady $A$, that he had reguirel in impossible enndition; hut he was surprised with the answer: ' lunt will you give me leave to do su?' As he could not in justice refuse, she ordered that proclamation le mould that In a certain day oo one shonld he away, or even lowk, from their honses, when, clothen only hy her lon: hair, she role through the town anil her hushaml, in almiation of her intrepid devotion. ferimmed his promse. This cirennstance was emomonnanted If a stained-ulass window, mentionom in 160, in St Michael's C'hureh, Coventry; and the legemul that an nufortumate tailor, the only man \%ho leoked out of a window, was struck blind. ias alsu fonm commemoration in an ancient eftigy of 'lecping 'Tom of Coventry,' still to le seen in a niche of one of the huldings. By a chater of 11 enry 111., 1218, a fair is heli at Coventry, beqinmung on Friday of Trinty-week, and lasting eight loys. The fair was olunel with a graml civie pricersion, a part of which was, in 1678, the reluesentation of the ride of Lady Gimba. These precessmas were continatel at intervals of from three to seven years, mutil 1826 . Some leantiful woman, who refresented Laty G., was the principal figure, but many other historical and emblematic jursmarges were introlucel. In 1548, the procession was revived with great splendour, and the spetacle attracted more than 15,001 strangers. The fair of 1862 was orened with a similar processim.

GODOLÖ, a market-town in IIngary, formerly the resilence of the princtly family Grassalkovich, is dastimguishen for its manorial eastic, as well as for the surroumling parks. It was on the woody ladithes of 6 . and Paszeg that the combined arme's of Anstria, under Prince Windischerate and Count Tollachich, were defeated in two blurly battles by the Hnncarians under Gobrati. On the eve of vietory, Giwerma Kossuth hed as conference with the fincrals Gügei, Klapka, and Banjanich, for laying lame the pineiples of the fammis Declaration of lndependence, issued on the 14th of April 1819, hy the diet at Debreszin. It was this tleclaration which served the emperor of linssia as a pretext for the invasion of Hungary.

GODOLPHin, Sumet, Earl of Gobolyimin, an English statesman, was deseended from an ohd Cornish family, and was horn, it is thought, about 1640. Aiter the liesturation he became one of the grooms of the ledechanher to Charles II., was apminted one of the serectaries of state in 160 t , and shon after first commissioner of the treasury; was twice despatehed to Holland in 1678 on lusiness of improntance, and argued and roted for the exchasion of the luke of Fork from the succession in 1650. Nevertheless, when the latter monnted the throne, G. (now Baron Chololphin of Rialton, in Comwall) was mate hori-chamberlain to the queen; and on the landing of the l'rince of Orange, he was one of the commissioners sent hy ling James to treat with the invader-a diflicult piece of business, which he is consilered to have managol with much tact and prudewe. William was not slow to perceive the admiable abilities of $G$., and in 1690 appointed him first lord of the treasury: In 169.5 he was one of the seven loris justices for the administration of the govermment during the king's absence. In 170 a, on the accession of Ame, he accepted the office of lord high treasurer, mainly at the solicitation of Marlhorough, who paid him a splendid comphment hy leckaring that otherwise he conld not venture to assume the command of the Dritish armies, as be conhl denend on him alone for puetual remittances. ( x . fully realised the expectations of the great Captain. He raised the pulbie eredit, induced the queen to contribute elloo,000 towards the war, tirmly opposed the selling of offices and places, and increased the stipends of the inferior clergy. In 17ot, (t, was raised tu the dignity of Earl of Gedodphin and Viseount lialtom; after this perjod he tork part with the Whigs, as heing more patriotie and English than the Tories. The contest between him amil Tarley fur the premiershig, resulted tinally in the Tefeat of $(x$, who was dismissed from oftice in 1710. He dial at St Albans, September 15, 1712, and was interced in Westminster Abbey: The title became extinet in his som Francis, second Lut of Goololphin. G. was the best business-man of his age. Dle hal the clearest and quiekest moderstanding and liked to to his work in such a way that it would not rapure to be done over again. In an age of compition, $G$. was believed to be incapable of bibery, and he never employed as his agents any except men of integrity. His 'talent for silence' equaller William's own.

## GODOY. Sce Aicubla.

GODS THUCE (Lat. Ticug Dei, or Trena Dei, from the Ger. Prom, true), one of the most singular among the institutions of the middle ages, which prosailed specially in France and the Germanic compire, lont was also received for a time in the ather conntries of Europe. It cansisted in the suspersion for a stated time, and at stated seasons and festivals, of that right of private feud for the redress of wrongs, which, unter certain conditions, was recognised hy medieval law or usage. I'rivate feuts, it is true, could only, by the medieval law, which was called Foumpreth and Fotedercht, be undertaken when judicial redress hat failed or cond not he cofored, and after formal notice had been served upon the party against whom they were levind. but even with this lmatation, private fents multiplied exceedingly. The publie peace was snloject to constant interruption : the weak were without resource; the strong lore down all liy the terror of their arms: and the whole social framework was so utterly disorganised, that men, by one of those religious impulses of which this age offers so many examples, fell back upon the aid of the chureh, and invoked her influence, as the only effectual
means of staying the cril. It was in this crisis that the 'Gmi's Tance' oriminaterl. In the cond of the luth c., a comeit assembled at Limoges, at which the princes and nobles bond themselves, i,y sniomn row, not only to abstain from all mulawfil femls, that also to liecp the peace mutually towarls tach other, and to protect from viulnce all dequeeless 1 rersuns, clerics, monlis, muns, women, merchants, pilgrims, and thats of the suil. A similar engigement was enteren into in a comeil at orbang in 1016: and the whole lanly of the linhus of Bmandy enforee it upon the in the lis everywhere throughont that luchy. A plaghe which visited a great part of Europe soon afterwarls give a fresh imjulse to the movement; and in the year 103:3, the 'Iloly Peace' was almost niversally reveeven, and for a tinse contimed to la religionsly oliservai. But as the wh abuse beran to revare by degrees, it was felt that the olservance womle carry with it more of religions authonity, if, instenal of being, as it had originally been institutenl, miveral, it was limited tu certain times and diays, which themselves hat certain religines assemiatims eonnecter with them. Accordingly, in 1011, the hishors of Aruitaine limited the God's Tmee to the wet-diays specially emacerated ley the memory of the fassion anel liesurrectom of Clirist-that is, from the sunset of Welnestay to sumrine of Monday. The same lecree was renowed at Narbome in 1054, and at Troyes in $10 \% \%$. At Clement, in lons, it was extendel to the whale interval from the le gimning of Alvent to the Equbany, and from the feginming of lent to Jentecost, to which times wore afterwards added seweral ofter festivals. These enactments ware adopitel or renewed at several later conncils; and although they were oiten disreqared. it is impossible to dould that they had a male amb lasting inducnee in mitigating the evil aqainst which they were directed. This simplar institution fell gradually into disuse, ami at fast disappearei altogether, when the right of private redress was restricted, and at last entirely abulished, liy the law of the empire.

GODWIN, Willua, an fonle - In athor, was
 17ath. 1lis fatherand grambather were Pashyterian ministers, ami haw whented fo the same profission, tiret at a scluoul at Now wheh, to whirh place his father hat remosent in 156 , where he male rapm pengess in clasian stades, and aiterwame at a frestyterian collow at lowtom, where he lursmed
 minister to a congreation in the mighanarhont of London: lint the 良eal with which he first enteret apon his duties delmat, abil of change in his theno hagisal opinions male it necessary for him to resign his charge. llis omly risome was to remove to the metropulis, and chase in literature llis tirnt work, a series iof / inumbital shathos, in the form of sermons, was musnecessmb, and he was rembeel to, pemury ami lespair ; lout they made him acyantend with Fux, 'homban amb other Whig laters, and he turnel his attention to pulatics. The Ameriean revalution, dosily followeal ly that of France. excital the pmblic mima, and of. wrote his Inviry Euncoming fotitical fustice, 1793. This was followed ly The Adturntares of ritph llilliems,s, is remarbatile nowel, intemed to innsiate the poln. tical views atvancerl in the Polition Juntior. An able defence of Ilorne lioke and others, published in the $1 /$ ormong (chominle, alvancel lis reputation; and in 1797, he pullishal The Inquirer, a collection of essays on morals am politics. Alxut this time, he formed an alliance with Mary Wollstoneeraft, the celebrated author of the hights of I'omon, and adopted and defended her extreme
social riews. Aitor some months, however, they yielund so far to custem as to be married. H ${ }_{13}$ wife died a shont time aifer in giving bioth to a ditughter, who afterwards leanme the secmon wife of the part Nhelley. In 179!, he puhbished at L.con, a romance ; am the next year viobed Irelame Where he asoofated with Curan, Grattan, and other eminent Irish political lembers. He aloo consoled himself fur the less of his wife ly writing lar Alemairs. In lanl, he married agrin, and hand a sin, who dicd of chatera in 1 siz. To secture a more cortain surport, (3, and his wife eprent a enenlating librury, bint he alsu worked indefatigatly with his pen to the eme of his life. He woute many schoul-bwhs, an ahmirahle hite of Chatuor (1sal); Flictuourl, a norel, : vols, (1sma); Mambrille, in 1817; a Triative on I'riphlution, is refutation of Dialthas, in $1 \mathbf{s} 00$; a Mintory of the Ropubic of limg.
 Thourflis an 1/an (1533). As he grew old, he montici his opmions un $\mathrm{p}^{\text {rolities }}$ and sucticty, ant espectially on marriage, which he warmly commends in sume of his later works. Reing now it years obl, he was apminted to a place nuler govemment, which remured him from the appelension of want; lat he knew not how to be infle, and wrote Delurnine, a novel, ane the Lives of the Sicrumoners. Many of his works were translated into fineign languazes. Ho died in London, Apri' 7 , 1436.

## (GODHWN, EAhL of Wrsex, a fammens Naxon

 mile, was born tuwards the eml of the loth century. Originally it is said, he followeal the oeanpration of a cow-herl; lont having foumd means to ingratiate himself with Elfr, the brother-in-law of King Cannte, the latter gave hin his danghter in marrage, and he som lemane one of the most powerfal of the English nobles. Nore than any wher person, he entributed t" the devateon of Elwand to the English throne (10.4 A.1n) ; and the pincipal reward of his services was the marume of his beatutul and aceomphished danglater bitha with the English ling. This mim, howewer, was mot a happy onc. Bditha was cruelly neghented ly Elward, amb her father, on aecome of his dishae of the Nommas, inemreal the royal enmaty. His cotates were seizend, amb given to faromites, and he and his family llech. (Vuen Vilitha was male to fect even mome litterly than any one the misfor. thmes of her fimily. Her own hashamel seized her duwer ; he tuok from har her jewels and her maney, 'even to the uttermont farthng;' and allowing her only the attendance of one masm, he closely conlimed her in the monastery of Whrerwell, if which one of his sisters was lindy-ahhuss. Meanwhile, sluals of Nomans visited Eingland for the 1mpore of making, or rather getting fortunes. Anong Elwarl's most favomed guests fur a time was luhe William of Simmandy. Better known as William the Compueror. The lanished carl, hawerer, had mot homille: through freguent comrenmadence with his comutrymon at home. he kept alive the antibatly of the English to the Nomman favarites of Giluaral. and in the summer of lose he lamed on the sumthern cuant of England. The royal trons, the may, and vast mmbers of the huriturs and peasunts, went over to him ; and fimally the king was forcel th grant his demands. The Nomans were for the most part expellell from the emontsy, the 6 . family was restored to all its p"ssessions ind dignities; and at a meeting of the Witemammite, the parls and all the best men of the land declared that the foreigners alome were to be helu gnilty of the late dissensions that had distraeted the conutry. G. diul not long survive his trimpls; he died April 7, 1054.EOCDWIT (Limaset), a genus of birts of the family rirolopecide, with wery long bill, slichtly
 the lihia lave. All the species frepuent manshes and shathm watera, whithy those of tho sea-cuast, where they sonk the ir fond liy wating and ley phomeg the Gundill inta the water or mbl like snipes. They smontimus alsor rum after small crustaceans or wothor anmals. and wately them ron the saluls, from which the the has retiret. 'Two speies necur in Britain,

mfrequent visitms of the marsty jarts of the east coast of Enchanl, where the first cecasimally lureets : but both gincrally beel in more nothomematries, and are seen in linitain thefly in their migations northwarl and smathward. Buth slmuts are very widely distributed over Emrone, Asia, amd Africa. The females are rather larger than the males, ame the whole longth of the female hack-tailso 1 is. which is rathre the largest specios, is about 17 inches, the hill alme lecing fom inches lons. Ther are much estemol for the talke and are sent from Ifalam to the lomin market, which also receives some from the fens of Lineohshire.

GOES, w. TETGOEN, a thwn and fortilied
 situater in a fruitful district in the i hamd of sinath beselanl, alont 3 , miles from its nonthem const, and 17 miles west of Bergen-61?-Vmm. It is well britt: has a harbure formed ly a camal commannicatime with the East sichemt, shimpuldins hacks, besmbes an aetive trade in hops, salt, and astrultural promince. I'pp. 5400 .
 ledser prince of doman jots, and one of the menst lidhly wiftel and varionsly acomplished mom of the isthe contury: Lle was lom in the year 17:4 at Frankfur-in-the Matime, where his vouthful years were spont. His fatlier, Johann kabna fon the, was an imperial comacilon, in fonel ciremmstances, and in a respectable position. In the yeme 176 , he wont to the miversity of Leipsie. of which limest an l Crellert were then the most motable omamonts. As a stment, he pointen, ly waterna professim, towneds the law: but his real stodies were in the wide domain of literature, fhilusulys, and abowe all, life and living charac ter. In ilre year 1720, be went to strathurg, to dimish his jumbical stadies; lut here also matomy amel chanistry, shakspare, Ionssean, and architecture anythins rather than the statute hookwectphell his time and exercised his sunl. Here it was that one of the earliest, certanly the most

812
frmons of those sontliful lowe-wiventures took phace, which, in his biograplyy, as in that of linbert liurns, play such a prominent part-the well-knowa attiar of lirederica Briov of seisenheim. With resand to thene matters in gencral, it may le sad that he was more realily movel tu live than intense in love; and that the olfects of lis admiration grarally seem to have had mure renson to lanat of the deheacy of his susemptibility, than of the persererance of his devotion. How far there was anything wore than commonly culpathe in these commetions, will always be a grestinn; certain it is that they will always tarnish to some coxtent the otherwise fair reputation of the frect. The female sex will never forgive the man who was sn light to lend his heart, and so fearful to give lois hand: and British marality will always be inclined to pass a severe judgment on the man who, professing the profondest subjection to law and orter in everything else, secms to have shrmak from the golden elasp of legitimate marringe as from sume conventional shackle, which a free ant great mature shomil avoind. In the year 1771, the gong pret, now 22 years of age, took his degree as Hector of haws, and went for a shont while to Wetalar on the lahn, the seat of the imperial chamber of the then Cerman empire, ant which
 in the stmly of public law. IFere, howerer, as in wher places, his knowlerlge of the human heart, and of haman character, altogether overgrew his professional stulies; and Wetzlar became to him the secne of the fimons Sorrous of Werther, a clowing leaf from the life of the limman sonl, full of interest and luaty at all times, but which, in the then state of Luropean thought and feeling, stimed the whale literary mind of Eurone like a hrecon sweeping aver a forest. The homk was nut pullishoul till 157. After retmong from Frankint, G. spent somo gears in his mative city, engased chatly in laterary prolnctions. His tirst great work was diat ron Bumbhomen, trauslated into English ly Sir Walter scott, publishel at Frankfurt. $17 \% 3$, which at wace set the Gemans free from the painfal constraint if Prencla and classical models, and opemed up tor them that carcer of fokd onginatity, which they have since prosecuted in so many deprartments of literature, learning and speculation. In the year 1775, 1 ., who bad that the good-fortume to gain the groml יpinion of Jian Ancrast, 'irand Duke of Saxe-Wemint, accepted an invitation from that prince tos settle in liss little cafital, since lreeme sor framo as the Athens of the ereat legislative age of Guruma literature. Itere the poet hecame it little stateman; and vesuring himself in wrims Ways in the service of his breacfactor. passed yrickly throngh stages of cont preferment, till, in 17T:, 他 lecame 'actual privy-conncillor,' at the as. of : $:$, lowhing the lighest dignity that a (ierman gulpect could then attain; a great, a rich, and an influential man. In 1-82, he received a intent of molitity; am in the following years, till 1758 , travelled innch in Switzerland aml laly, of whels last jommey we have the leantiful froits in 1 p hif nit, Eymont, Theso, and the J'onctien ond Roman Elegies. Ui this last work, thoronghly German both in form and fedins, the herume was Christiana Vulpins, a highly attractive thongh not a highly gifted woman, whe bere him a chid-lis eldest son-in 1789 ; but whom, though he always treated her as bis wife, he did not formally mary till 1800 . In 1792, he took part in the Geman campaign arrainst France, of which he has left a memoir. In the year 1815, lie was made minister of state. After the death of the grand duke, in 1808 , he lived mach in retirement, oceupied oceasionally with poetry, but much
more intensely and constantly with the stuly of nature and the fine arts, which from his earliest years hal prssessent the stromot attractions for him. He dicl in Mareh Is'on, in his eighteforth year.

To give a detaled account of the literary and sciontific productions of (d.'s pen, is altopether impussible within the limits of the present wot: much less can we attempt any detailed critecinn of these works. The hest sonrce of reir renn th the mere Endlish realer is the linamphy of the foct, by G. 11. Lewes ; along with which may be taken (i.s interesting conversations with felkmann, translated ly waenford. In the peneral chatrater and literary pasition of 1 r.. honweter, a fow worls are necessary. It is as a poet. no dombt, that this remarkable man is en nemally known amb renes. nised in this comatry ; lat it is mot as a put only that a just measure can le takno uf his intellectual califre of of his European simincance. It is as poet, thinker. eritic, and urimal moswer of nature, all combined in one whmathe harmony. that his rave exchllence comsists. We do mot find in literary hintory any intellect that an litly low ghaced on the same platiom with $1:$ : that $1^{\text {me }}$ sents, in stwh mathel and pracefol (ompletorn'ss, su much severe thongt, combined with an murh haxuriant imanation; so mneh acenate seience with so much phayful fancy: so much simplicity with so mulh art; so much frethess and ariginality of prolmetive pow r, with som meh justress anl comprelnowenes of criteal jutument. is a dramatist, (i, will mot comprate for a mome with the great masters of that ant among omeselves. His Enghish himapher detects in the comstitution uf his mime, moot justly, 'a simular absence of listorie feeling and "tramatic puwer.' Not less correct is the jubument of the same writer when he says: 'Gouthe was attachent to charact rand piature, imifferent to action and 'vent." In this respect, the poet was a true type of his nation. As contrasted with the French and Enelish, the Germans are deficient in nothing so remarkahly as in stirring passion and procressive enerey ; the relation of G. to thakspare and the linglish drumatists is exactly the sames Nevertheless, Fuest is a great Iwem, eren a grat dranatic prom, for it is full of dramatic scenes, though they are mot suffechenty moved hy the living eurcont of dramatie action. Fulat is essentially a dierman poem, amb jet a frem which all foreighers "an rearl and engoy. It is the great drama of that monal and motaphysical qucstioning which thonghtinl minds must -0 , thremuh in all times and places, hat which has receised the
 Cremany. Of the other pretical works of ia.,
 those which mont strmoly bar the type if the rim manhond of the author. The form and style of these classical works are characteristically firck: ly which we moan they are hietly remarkable for profundity of thonght and truth of fectines expressed in the moet simple, praceful, and umpetembing manmer. In som, hamerer, they are essemtially Gemans: and the most dere thinking of the Gomans are always the liret to cham (a) as the mont Gemma ofll Coman pocts in spirit, thomish very few grat lieman writers have so catially avoided the most chractoristic (ierman defects of style. In the extramelinary value which he attaches to "the form, ' 8, authentivates himself "rerywhere as at once a reat mondern (ireek anl a reat artist.
G. is a pret who is theroughly relished only by those who understan! thoronghly the (remazn linguage, and whose minds are not so typically English as to exclude a ready sympathy with

German thoughts and folimes. With general
 alwas: bee the farmurite poet. Nevertheless, there hat inem a eonsideralde anment uf literars puwer in this country sont in the tram-lation of 0 a.s werke, sumally of his great work, ther Fense; of this, at least it ilown tramalations exiot, the mest

They are 14 fect high, and oceny suitahbe perlestals in cmathall. The ancient ethigies, which were mante of wicker-work and pastehnarl, were carrien through the strects in the Lonl Mayor's thows, and endies nit the pesent giants were in the slum of 1s:3. Fommerly, other towns in Bugham had their giants and there are fomous and sume very large nows in surval entinental citiss. The Antigums uf Antwerp is 40 foet high anl was formenty carried in the most ablam religions as well as civie procesions. liayant, the giant of Womai, is ore fot high. There ate also giants, and families of giante, at Lille, Malines. Brasices, \&e, ead comnecteal with amme 1 "halar tradition uf their respective vities. The arms of Antwerp, a eastle with serered hands, are comocted with the lesemd of the uiant who lived in the castle, and cut of the hands of than who failed to pay his exactions. Though it is mew impusible to ascertain the facts, there ean be littlo iloulat that all these ciric ginats are exaserated repesentatives of real persus and erents.
docinli, a river rising in Nepan, alout lat.
$27^{\circ} 20^{\prime}$ N., and long. $85^{\circ} 46^{\prime} \mathrm{E}$., joins the Coosy, an affluent of the Tanges, in lat. 2. of N., and lony. $5710^{\prime} \mathrm{E}$, after a course of 235 miles.
domo, a large town and a seaport of Pritisli luma, in the presitency of Bembay is situated (on the west shore of the Gulf of Cambay, and has safe auchorace during the south-west monsoon, with smooth water and a moldy bottom. It is in lat. $21^{\circ} 3 y^{\prime} \mathrm{N}$. , and loug. $72^{\circ} 15^{\prime} \mathrm{E}$.

GOGOL. Ninolal, a Jussian anthor of great and original genins, was bon at the village of Wassiljuwha, in the govermment of Poltova, in 1810. On finishing his stulies, be went to St letershurg, and solicited govermment cmphyment, which was refused, on the gromml, that be dill not know liussian.' Shortly after, he proved that the officials were in the wrong by publishing a collection of novels and sketehes, entitled I'chera no Khutorie (Evenings at a Farmhouse). The first and most jmportant of these tales contains a vivid picture of Cossack manners, enabling us, aecording
 antipathies that have for ages characterised the relations of certain brancles of the Slavic family to each other. Then come the 'King of the Gnomes;' the '1listory of a Fool,' which is more a satire than a psychological study: and 'The House-kceping of Former Times,' a little masterpiece of its kind. The success of Encmings at a Fetmhouse was immense, and liussian crities combared G.'s style to that of Washington lrwing. It was followed by Mirgorol, a supplementary volume, of the same character, containing storices full of poetry, and exciting astomishment not less ly the vigone and grasp of mind displayed in the dolineation of character, than hy the extraordinary skill with which the plots are formed and unravelled. G. now turned his attention to the dramatic art, and prodnced the Revisor, a comedy of hrilliant genins, whose appearance on the stage excited quite a furor. The purpose of this pice was to expose the rowted abuses of the internal administration of Jussian aflairs. The Emperor Nicholas was the lirst to appland its morality, and shewed his approbation by apointing the author professor of listory in the umiversity of st Petersburs. While holding this otfice, be publishenl, in 1812, Pokhazhlenigia Chichugora ili Mermuina Dushi (Adventures of Chicharov, or Deat Souls), of which a bad translatinn appeared in English in 1854, under the title of IIome-life in IRusial). The aim of this novel was to extinguish serfiom by ridicule. Exhausted by his labouss, $G$. sought permission to travel, and visited Italy, where he took up bis residence. There, however, his opinions appear to lave undergone a change. From being an ardent linssian liberal and reformer, he became an apologist of despotism, an apostasy which he lived to regret. After the commotions of 1848 , he retumen to linssia, and died at Moseow in 1851.

GOH1LWAR, or GOHELWA1), a mative principality, tributary at once to the Guicowar of Cinzerat and to the British government, lies on the eastern coast of the peninsula of Kattywar, stretching in N. lat. from $20^{\circ} 50^{\prime}$ to $22^{\circ} 3^{\prime}$, and in E. lougs. from $71^{\circ} 14^{\prime}$ to $72^{\circ} 133^{\prime}$, and containing 3500 square miles. and $2 \cdot 17,980$ inhabitants. The chief's reveune is about 740,000 rppees a year, out of which he pays two tribntes, about 80,000 rupees to the foverment of Bombay, and about 40,000 to the Guicowar.

GOIL, Locir, a small but highly picturesque loed in Argyleshire, Scotland, is a branch of Loch Long (q.v.), and is six miles in leugth, ame about one mite in brealth. Its shores aro for the most part
wild and rugged; but the general character of the scenery is moditied ly extensive natural woods of hazal, which stretch along the shore. The mountains in the neighbourhool rise to the beight of ahout 0500 fect, It may be visited by steamers from Glassow.

GO'1TO, a small town in Lombarty, about 15 miles nurth-west from Mantua, occupes a beautiful though somewhat marshy position on the Mincio. This town, owing to its vieinity to the stronghold of Mantua, has been the tield of various military merations. In I6:3n, it was carried by assault by the imperialists, who entered Mantua on the same night, anel took it hy sururise; during the war of the Sunish Succession in 1701, it was alternately captured by the allies and the imperialists; ant in 1796 the lirench took it, but were expelled, after a brief temure, hy the Austrians. In 1814, a severe engagement thok pace at fr. hetween the Austrian and Italian troops; and chuing the war of independence in 1848, it lecame the theatre of two further battles between the same powers, to which it owes its modern celebrity. I'cpulation inconsiderable.

GORTRE, an enlargement of the Thyroid Gland ( $q . r^{\circ}$ ), occupying the front of the neek, and sometimes of such a size as to project downwards over the breast, and even to admit of being thrown over the shoulder. Goitre is for the most part an endemic or local disease, being foum in the monntainons regions of the $A l_{\text {ps, }}$ Andes, and Himalaya, especially, it is said, where lime prevails largely as a geological formation. The proofs of goitre being connected with a calcareous impregnation of the trinkingwater are rather strons, but perhaps not quita sutficient, especially as regards this conntry, thongh the chief seat of goitre in Eugland, Derbyshire, is sulbject to this allecged cause. Goitre is met with enclumically, to a slight extent, in various prarts of Scotland; hat on a very small scale indeed as comgared with switzerland, in which it is a very important deformity, especially when eonnected with Cretinism (d.v.). Gnitre is of two kinds: the one due to increased development of the vessels of the glaad, the other to the growth of Cysts (I. v.) in its substance. To these might perhapis be aded a thirel, which is found in comection with functional disease of the heart, but which is perhaps only a variety of the vascular goitre. The nsual treatment of goitre is by the arministration of very minute doses of Iodine (q. v.) for a long time together. The use of this remedy is due to Coindet of Genera, who recognised it as the prineipal source of the virtues of burned sponge, long of high repute in the treatment of goitre.

GOLCO'NDA, a furtress of the Nizam, sitnated seven miles to the north-west of his capital, Hyderabad, stands in lat. $17^{\circ} 22 \mathrm{~N}$, and in long. $75^{\circ} 25^{\circ}$ E. In its immediate neighbourhool are the ruins of as ancient city, once the metropolis of the kingdom of Golconda. The place itself is still strong; lont its strength is serionsly impaired throngh its being overtopled, within beaching-range, by the yet solid mansulea of its former sovereigns, which form a vast group at a distance of 600 yards. These tombs are dome-crowned structures of gray granite, each having its own mosque, and occupying the centre of its own devated terrace. G. is proverhially famons for its diamonds; but, in truth, they are merely cut and polishcd liere, being generally fonma at Parteall, near the sonthern frontier of the Nizam's tominions.

GOLD (syinbol An, atomic weight 096 ) has heen known and regarded as the most precions of the metals from the earliest ages of the world, and has been universally employed as a medium of
exchange. Although the quantity of $G$. which is fomm, when compared with that of many other metals, is small, yet there are few parts of the globe in which it does not ocenr more or less abunilantly.

In the mative state, it occors crystallisal, the Irimary form lwing the cube, or in platos, ramiticatoma, or nodules-popraty known as motge ts which sometmes are of very emsinleralne size. It is almost always alloyed with silvor, aml samutimes with tellurimm, lismoth, leal, fee it sonetimes necurs in small frantity in metallic sulphides, as in galem, irun and colyer prites.

The extraction of G. from the substanees with Which it is associated is ctlectenl more by mechamical than by chemica! meaus. See below.

The following are its most important propertirs. In its compact state, it jrossesses a charactiristic yellow colour am! hish metallic lustre, is nearly as soft as leal, am is the most malleable of all motals. It can he baten into laves of a thmoss not

 a green tint; one grain may thus he distributol over $5 t^{\circ}$ symare imehes of surface ; and the ductility of the metal is so great, that the same pmantity may lee Irawn ors into stlo feet of wire. In its tonandy, it is inferine to irom, platimmon, conere, and silver; but a wire whose diameter is $10-67$ for rathor more than one-third) of a line (which is oncotwelfth of an ineh), will support a weight of about 150 llos . It fuses at abont $2016^{\circ}$, accoriling to Daniell's pyrometer, and when in fusion, is of a hluish. green eolour. It is scarcoly at all volatile in the heat of the furnae, hat ly a powerful clectric discharge, by the eoncentration of the smis rays by a powerfal hminur-olass, why the oxy-hydrogen jet, it is lispersed in praple viapous. (t. has very little atibuty for oxyyen; it harleranos no chandere on exposure to the atmosphere, and is matlerted by bydrocharic, sulpharie, ar nitric acil, or, in shart. by any simple ache exerpt selonic acid ; nor do the alkalies alleet it. It is, however, dissulbed hy any mixtme which liberates chlorime its nsual scilvint being equel requit, which is generally prenared by mixing $~$ part of mitric acid with 4 garts of hydrochlonte achol. Ilydrochloric acul to which hiuoxide of mangratise has leen arlibin, acts equally well. the 6 . in these casis luiner comserted into a chlomile. This mortal is whe of the monst perfect concluntors luth of heat and of clectricity: When precipitated in a fimely commanuted state, it is of a brown colour ; bat when suspenelad in water, amol riewed ly transmitten lirlit, it aplears purple. The specific sravity of thas mutal is leos than that of platinum and irillum, ramping from 10 ? to 194 . acconling as it is fusced or lammered.

The alloys of Gi, or or $^{\text {atmbinations with other }}$ metals, are very mumernas, those with culler and meremy being the most important. Cinper and G. cumbine in all propurtions withont matcrially affecting the colour of the latter, expept that it is somewhat redler. The density of the componal is less than that of $(\mathrm{r}$, but the hardh.ss is greater. and it is mure fusille. It is this alloy whieh is employed in our golle eninage, 11 parts of (a, being connined with 1 of endper, withont winch the cuin would mot be sulficiently haved to, stand tho wear to which it is expusecd. Mence Lritish staulard C. contains $s: 33$ per ecut. of cupper. In lirance, and in the United Status, standard (? contains 10 rer cent. of the lattor motal. Jewellirs alhy their 6. with other metals, partly on economical groumls, and partly for the purpuse of evolving special tints. Thus, reel $A$. is clltaince by combining 75 parts of tine G. with os of copper; green $G$., ly combining 75 parts of fine G. with 25 of silver; dead-leaf
G., ly eombining 70 parts of fine fi. with 30 of silver: water Green ( $f$, , by connhining 60 parts of fue 6, with 40 of silver ; blue 6 ., by combining 75 parts of tine $f$. with 25 of irm.
Ahreury and G. combine very readily, and yield a white alloy, termed an cmollyom, which is used in gilding. In ensequence of the realiness with which these metals unite even at orlinary tomperatures, mercury is used for the extraction if grold.
As a general rake, the ductility of $6:$. is mach impared ly alloying other metals witl2 it, while its harducss anl somernsuess are increasiof.
Two oxides of (G. are known-a protnxile, Aun, ranl a teroxile, $\mathrm{AnO}_{3}$. Neither of these oxides can be firmend ly the direct union of the elements, and luth of them are rewnered ly harat. The protexsile is a diark-green or haish-violet powider. It forms no definite salta. It is oltainell ly the decompusitim of frutichloride of $G$. with a solntion of petash. The turoxide is a bruwn pmoder, which is relluced, mot culy by beat and lieht, hut by many other rellucing aficnts. It comlines more realily with Mases than with acids, and hane bas leen terned curcic ucill. Wie oltain it hy mixing a solution of terchluride of (s. with maginsia or earbonate of soma, and loniling.
Two chloriles of (t. arr linown, corresponding to the wiiles, viz, a frotuchbornle, Ancl, and a tepchloride, Aucl ${ }_{3}$. Of these, the latter is the most important: it is olutaino d ly dissolving ( B , in aqua reyia, and evapurating the sulution to Gryness, at a temperature not extecding 3up, when we cultain this compund. as a deliquescont yellowish brown
 and ether, with whind it forms cramge-chlured solutions.
The chlorides of many of the argauic lases furm crystallisalle domble salts with the terchbride If (a, ; and thase cmporminds are often cmployed th letormine the combining power of the "rganie alk:lli.

Netallie $G$. in the form of a hrown powder is thrown down from the solution oi the turchlarile ly most telucing agents. This rechuing power of protusulphate of irm is emplosed in the promation of chemically pure gral.
A lismlphinde of $C$. is chatained in the form of a Mack powher by passing a corrent of smplmeretted lyalrowen throuth a enll solutum of tercllumile of gitd. 'If tinety diviles gndel he heateel with sulphur in ernatact with cartunate of potash, a doulde sulphite of goll and $p$ notassium is himmer ; it resists a red heat, and is very suluble in water; this sulphur salt is usel fir gilding china, and lroduces the chamr known as Burgow lustre'- Milleq's Elemarntw of Chematry, 2 l edit. whl. ii p.it.
 alelumists, who (Basil Valentine, for example) formed solutinus of trechlarive of G., ocurs as a green puwder, when prepared live imnessing teroxide of C. (ur anris avid) in caustic anmunia. ly modifyins the male of 1 reparation, we oftain it of a hriwnish yollow colomr. From Duman's analysis of the green inwider, it scems to lee relpesented by the fummla $2 \mathbf{N H} \mathrm{H}_{\text {..Aut }}$, the brownish-vellow foweler havius a more emmplicatel formula. These powlers detonate when rubhecl, struck, or leaten, or when an electric spark is passeld through them, with a loul shary rewort anil a faint light, and they yield nitrogen gas, ammonia, and water. Nune bit professed ehemists should attemplt to prepare them, in emsequence of their lantrems explusive character. On one oreasion a drachun of fulminating 0 . iutroineed into a louttle harst it as the stipper was beiny turned rouad, in consequence of suall particles of it having adbered about the month, and both the

## GOLD.

merator's eycs were elestroyed liy the projected fracments of elass.

The Paple (usems is an important gold compumel. It therives its name from its haviog

None of the salts of the watues of of are of sutberient impnitance to require notice in this article.
Far the descriptimn of Mosaic firlt, see Tis.
Gont was, in all prability, we of the earliest discoreded of the metals. 'The fiact of its being fumblery gencrally distributed wer the surface uf the earth. and that, too in its simple mactallic state, combinel with its bontiful colomr, and many rahahle properties, would canse it very early to attract the attention of man. Accomingly, we learn that goll was used ley the ll Jrews, the Egyltians, and other ancient intions, for much the same purposes as it is at the present day:
lrevions to the neat Cahornian diseovery in $1 〕 \pm 7$, Enurne was tu a quat extent supplied with G. from Dlexion, Prazil. New Grmada, Chili, and l'en in North and sontls Anvelica; a lave quantity was alsa mitancid from Asiatie linssia and the islinuts of the halim Archipelam: the east and west enast uf Arica furnished a less lout still consileralle quantity. All these combtries still produce (i.. hut their total yiehl, inehuling Europe, is only alnout one-forrth that of California and Australia.

The must famons mines in Enrope are those of Huagary and Transysania, wheh proluce anmaly
 and Spain are almost the only other European conntries where (:. is worked; hut it is foume in all districts whe the rivers tlow over pronary rocke, though rancly in sufficiont ymantity to repay the expense of working it.
(x. las hecn fund in several parts of the lritish Islands. The most productive district yet liscovered was that of Wicklow, in Treland, where, towards the close of the last ceutury, the strean-winks were prosecuted for sume time with cunsidurable success. In seotland, the lealhills. on the borders of Dumfriesshire, as well as the Hichlands of Perthshire, have at varions times proliced (f.; so also have Comath and Inwonshire in Endind, and, at the present time. a mall quantity is being oltained from Nurth Walus.
First amones the chebrated ghld disconeries of rucent times, in loint of diate, though not in import ance, come those of Eastem Siberia, where extensive auriferns tracts were discovered in the governments of Tonask and Yeniseisk in 18t?. The quantity alitained in these eastem regious raised the ammal produce of the limssian empire ta three and nitimately to fon millions sterling - mome than triphe its furber yith. Concernine Pussia, it may the well to ramak that ancxamination of the auriferrus deposits of the I ral Mumatains led Sir Pomerick Marelison, in 181, on comparing their rucks with those brount home ly Count sitreclecki from Australia, themethet the presence of 19 . on the latter contineat. Subsequent discoverics, as is well kown, have provel the acturacy of this conclusion in a Yery remarkable decree.

The rich gold rection of Califurnia was discovered in Sopitember 184. Mr. Marshall, the contractor for a saw-mill on the estate of (aptain suter-a Swiss cmigrant settlenl on the banks of the sacramento Fiver-detected particles of G. in the sand of the mill-race, and un further examination, it was fomul that valuable deposits exinted thronghout the bed of the streath. Intelligence of the discovery som reachel the town of Sin Francisco, whose scanty perbution at once abanduned their usnal uccupations to join in the exciting search for 816
gold. The surply was som found to he abundant over a large area; it acemred in the trihutaries of the sacramento as well as in the beal of the river iteelf, in ohl water-courses, and on the sides of the hills. limigrants quickly poureal in from all parts of the Amencan continent, anl ere long from Ibritain, Cemmany, and other Eurone: comitries, till the Tomation of Non Francisen alone rese from under 200 in 1855 to 41,000 in 185 s . At first, it was thoungt that the suplly of 1 from this region wohl sonn fail, lout it would appear by later researches to be far from heing easily exhanstei, as the supply, though now apmarently decreasing, continned for several years at upwarls of $813,000,000$ jer anum. Scesns Frisario.
In 185l, lofone the excitement of the Califorman diseovery had time to subside, the worh was startlei ley the amomecment of another, or rather by a suries of others, of not less importance, in Australia. It is a curious fact that not only Sir R. Murchison, as stated above, lut also the Rev. W. B. Clarke, a native gedlogist, had pointed out the likehhome of ti. being fond in the castern chain of the Anstralian monatains, several years before the value of the gold-fithls near loathurst was discovered by Mr Magrases in April 1851. This discovery was no sonner made, however, than several other places in lathurst and the adjoining connties were foum to contain rich deposits; so that, before many month had passed, 6000 persons were employed at these did!inge. In August of the same year, further disconeries of 6 . Were made at Fallarat, in Victoria, which excelled in rielmess those of the Syeney district : and these, in turn, were soon surpassed by fresh discoveries in the Momit Alexander range. During the climax of the excitement created by the Victori: grala-fields, the number of diggers rose to upwards of 90000 , withdrawing for a time the creat mass of the pophation from Melbourne ant riectong.

The moles of working adopited at the first start of the dipgiuss were necessarily rule ami wasteful; the fortmues of the ofold-sechers, ton, were of coursa very variable under such a system, many of them having made large profits-as much. in a few instances, as a thonsand pounds and upwards in a single weck-but many more met with nothing lont disaldmintment. A more syst matie 1 an of mining, howerem: has now been intrembed, ly which the auriferons eleposits are more connletely worked out, ant the labour of the miners rentered less precaroms. Jotwithstanding this, the annual prodnce of the Australian colonies has now (1862) fallen to abant $55,010,000$, only twa-thirds of what they protheed a fere years ago. In the International Exhibition of 1502 there was a gilted pyramid 10 feet syluare at the hase and 40 foct high, representing the mass of gold exported from Victoria hetween the 1st October 1851 and the 1st October 1861. Its weight in solid goh wonld have been $26,160,432$ ounces troy, which, takell roundly at \&t per ounce, gives its value as £104.049.2S. The produce of California since the discovery of its golifichls in 185, ul to the present time, may be estimated at almut $37,500,000$ onnces, and its value at $£ 150,000,060$.

Since the two great gold regions of Califurnia and Australia becane known, three new ones of considerable promise have been discovered-one of them in British Columbia, the value of which was proved in 1858 , although previously it was to some extent known to the Hudsun's Bay Company ; another is being successfully developed in Nova Scotia; and a third in the province of Otago, in New Zealanl, the recent accounts from which are yery cucouraging. It would appear that there is a
great similarity letween the general roek systems and amriferoms deposits of this rerion and those of Anstralia. Before passing from the subject of recent gold-fields, it is worth woting that, a few years ago, Dr Livimestone tle A friean traveller diseovered G. near 'Tete on the Zambesi-a listrict which may be fonme to be rich in the precions motal, when more deliberately surveycel. Its position is remartiable as oceurring in the eentre of a conlefindel.

The ammal froduce of 1 i . in the whole worlid at the present time is somuwhore betwem 3 amd 40 millious sterling Wherever ( i . is fomm, its origin ean generally be traced to puarta reins in the primary or volcanic roeks, such as ranite, gneiss, porphyry, elay-state, or eremotome is these rocks lrecome cheomupnsed los the action uf the weather, portions of the ampiforous veias are carried down hy streams and Howls, and so fiml their way into the deposits of somd. clay, and shingle in river-beds, and in the gnllies and thats of hills. Jany auriferous drifts are of uroat theleness, formed hy long-contimmel wastine of the roeks of nefthboning hills, and theremere requine mining to a consideriable depth. (i.for tly bunst part is found in small grains, or seales, eallud whl. clast: some of it, howerer, in pienes. wr muts ts of consislerable size. 'lhe lirgest yet met with was foumd at Ballarat in 155 , called • The Whemme;
 A groxl deal of the Mexican aml Emronean (i. is olitaned from auriferous pyrites: that is, the sulpharet of iron, copper, or arseube, with the Q. disseminated thromer it.

Nearly all the metals except for are fomme for the most part, at least, as wes ehmaically emmbinal with oxyiden, sulphur, or othor sulstances; and they thereforo reyuire to lee separatel lis ehrmical
 Jally only repuire to he medanically treated by the processes of crushiner, stampiner, grinhine, anil washing. 'Ithe analgamation process, however, is pesorted to when the G. wears in a state of fine division.

The crushinw-mill cusists of two larese ast-iron eytimelers or rullers revolvine in ppmsite duretions, which break the ore into mall pieces as it pheses through between them. 'To reduee it further, a stamping-mill is nsed with inn-shoul piles of whom, or sometmoes with stanpers entirely of anom, wromat by an axle with projoctine cans aiter the fashinm of flont-mills and lnetlimer-mathines. Tra pulverise it still further, any form of erinlinemill is uscol, but the grimitiner surfaces should be of irwo or of shmate hard rock hae gramits. 'the pmomsed wre is finally sifterl and waslend loy machmes. which vary in shiare amd monle of winking. lat they all eomaist

and has frequently been quoted as an example of the livisibility of matter, as one inch of the highly ghlded wire contains but the cighty-millionth part
 a visible quantity exhibiting the colour anl lustre of gold, eontains but $\frac{1}{500,000,000}$ of an ounce, or one ounce of gold covers more than 100 miles of wire. This thattened gilded wire is then womm over the sills, so as to enchise it completely, and produce an appurently gohen thread.

Other means of directly gilling the threal have been tried, and for some phrposes are successful, lut none have yet been discovered which give the thread the same degree of lustre as the above, which was first practised in a ruder manner by the flindus.

Mr llock's methol of filure gilling is to pass the silk through a mneilaginous solution, and then receive it ou a brass cylinder, over which it is closely rolled. Goblleaf is then laid upon this coil of gummed sill, and thus one side is coated. The other side is gilded by rolling it from the first on to a second eylimker in the opmsite direction, thens the phain side falls ontermost, and is then coated with goldeaf as before. This is rather cheaper than the fibre phated silk, and more flexible, but not so brilliant.

GOLD MNES. In England, the erown has primu fucie the right to gold mines; but where the gold is found in other mines, the crown is entitled only to take the gold at a fixed price. In Scotland, by an ancient act of 1502 , the owner of the ground can demand a fen thereof from the crown, on paying one-tenth of the produce.

GOLD OF PIEASURE (Camelina), a genus of plants of the natural order Cruciftere, baving an erect calyx, small bright yellow flowers, ant intlated pearshapert or wedge-shaped pouches. The species are few. The common Goll of I'leasure ( $C$ '. sativa), (Fr. Cameline, (ierm. Dotter) is an annual plant 1 -3-3 feet high, with teminal racemes and pear-shaped ponches; the leaves smonth, hright green, entire or slightly toother, the midule stem-leaves arrowshaped ani embracing the stem. Notwithstanding its high-sounding Euglish name, the plant is of bumble and bomely appearance. It grows in fields and waste places in Europe and the north of Asia; it is not regarded as a true uative of Britain, althongh often found in fields. partieularly of flax, its seed being very commonly mingled with Haxseed imported from the eontinent. In many parts of Cermany, Belgium, and the sonth of Europe, it is extensively cultirated for the sake of the abomdant oil contained in its seeds. The seeds and the oilcake made from them are also used for feeding cattle, although inferior to linseed, and to the oilcake obtained from linseed. The oil, although sweet and pure at first, is very ap't to become rancid, and is less valued than that of rapeseed or colza; the seeds of Gold of lleasure are often mixed with rapesead for the production of oil. The value of the plaut in agriculture depends much on its adaptation to poor samly soils, although it prefers those of a better quality; and on the briefness of its period of vegetation, adapting it for being sown after another erop has failed, or for being ploughed down as a green manure. The seed is sown either broadcast or in drills. The erop is cut or pulled when the ponehes begin to turn yellow; but the readiness with which seed is seattered in the dield, rendering the Plant a weed for future years, is an objection to its cultivation. It is not nuch cultivated in any part of Britain. 'The stems are tough, tibrous, and thathe, and are used for thatching and for making hrooms; their tibre is even separated like that of flax, and made into very coarse cloth and packing-paper.

## GOLDAU－GOLDEN゙CTES＇TED WREN．

The seels are usod for emollient poultions，which allay bain，particularly in cutancuns diseases．

GOLDAU，formerly a small town of Switzerlam， in the canton of schwytz，was situated in a valley hotwen Nomnt liassierg on the nomth and Aomat liki on the sonth，tive miles moth－west of the town of ぶchwytz，and is memorahle for its destmetion lyy one of the most stmpemons and fatal lanislifis nin recond．＇The uper partion of the slone of the Rossharer，consistine of a layer of stome sooting ons lizht sond，had been lonsemel by continumas mins， which preolater mulure the ronk，and in at masure washed the suil from leweath it．On the el fop tember 1sob，thward the evening，the onter lityer of rode became rompletely detached．and rushaidum the monntain in a sonth－western direction into the valley．In a few mimutes nos mily（：，but tha mighbouring villares of Finsingen amil lothon wer worwhelmet in lestructions，a part of the Lakn of Lanwerz was dillol up，and by the sumben over flowing of the water the lame to the west of Secwen was revantated．Two churches，111 dwell－

After the duath of Charles $V^{-}$. the burgudg-hamish line of the llunse of Austria remainel in pussessiun of the
order: lout at the close of the Spanish war of succession, the emperor, Charles VI., laind clam to it in virtace of his possession of the Netherlames, amb taking with him the archives of the arter, celoluratod its inamguration with great masnilicence at Vitman in 1713. Philip. V. of same cont asted the claim of Charles: aml the dispute. siveral times renewel, was at last tacitly alljusted lis the introduction of the order in botio comutres. The insignia are a golden ilece hamene from a fohd and blus cmandled Hintstone cmitting flames. and lurne in its turn by a ray of dire. On the emanelled olverse is inseribel I'ritum luborum non rite. The deecration was originally suspended from a chain of alternate firestones and rays, for which "harles $V^{\prime}$. allowed a real ribloon to be sulstitated, and the chain is now worn muly lye firmel-Master. The Cumish decoration ditfers slightly from the Austrian. The custume cunsists of a lonis mole of deep red velvet, lined with white tafletas, and a long mantle of purple velvet lined with white satin, and richly trimmed with combroidery containing firestones anil steels emitting flames and sparks. On the hem, which is of white satim, is cmbroiderel in goll. Je loty enpors. There is also a cap of purple velvet cmbtrailered in goll, with a hood, and the shoes :mill stockings are red. In Austria, the emperor may now create any number of kniglits of the Tamben lileece from the old monility; if l'rotestants, the $\mathrm{l}^{\text {whe's }}$ consent is required. In Spain, princes, grambes, and personages of beculiar merit are abone cligible.
GOLDEN LEGEND (Lat. Aure Legemer), a velehatel collection of hasiolugy, which for a time enjosed ahoust une xampled popharity, laving passed thriugh more than a humdred editions, and translatinns into ahmost all the Eurorean lansuares. It is the work of Tames de Voragine, also written 'Vragin,"
 INe enterell the bominiean order, and was electent, at a comparatively early are, prosincial of the onter in Lominarly in 1207 . Towarls the enel of that century, he was dected Archlishop of Cenoa; and ly his alsility, his mondeation, ame his exemplary life, be phayem a most intluential part in the pmblie atfairs of his time, being called more than once into the contacils of the propes themselves, in atlairs of dithenty: The Lesenda consists of $17 \overline{1}$ sections, each of whel is deronted to a particular saint or fertival, selected aceraling to the orter of the calomitur. In its excention, the work, as may well le supmoed from its age is far from critical, hut it is olesersiner of stmily as a literary momment of the 1 erivel, and as illustrating the religious halits and views of the Christians of that time. It presents a very different plase uf the medieval mind foum that which is cxhibited in the achte and severely milnsembical hacubrations of the schools: lat loth must be real together, in order make up the intellectual ideal if the time.
(:1)LDEN NUWBER for any year is the number of that year in the Metomic Cycle ( $(9.6)$, and as this cycle mbinaces $1!1$ years, the from 1 tols. The cycle of Meton came intor general nse sum after its discovery, and the number of eath fear in the Metonic cycle was ordereal to be ensraved in letters of gold on pillars of marble. lonee the urigin of the name. since the introduction of tha Grequrian calendar, the point from which the golden numbers are reckoned is I B. C., as in that year the new mon fell on the lat of Janmery ; and as ly Neton's law the new moon falls on the" same lay (1st of Jamary) every Ithth year from that time, we obtain the tollowing rule for tinding the golden muber for any particular year,

 Le no remaimeter, then 19 is the gelden mombty, and that your is the host af the cycle.' The whilen number is nsed for detominiag the Epract (if. r.), aud the thme for holding linster (q. 5 ).

GULDEN-ROD (Solitup), a menus of plants of the matural order (ompositor, sub-urdior Corpmhifere, clusely allied to Astor, hut distincuishend ly the single-rowed papus and tapring-- mot com-pressed-fmit. The species are natives chiedly of termerate climatos, ame are most numerous in N゙ッth America. A few are limmpan; only on is Tiritish, the Commos (t. (s. J'irguret), a perennial phant of very variable size, as there is a small alpine varicty (sumetimes ralled s. C'embina) only a fow inch's high, whilst the common variety, fonnd in wools anil thickets in most purts of liritain, is from one to four freet hish. It has crect panieled corowded racemes of small yellow flowers. It is an ornamental flant, and is sometimes seen in garlens. It had at one time a great reputation as a vuluerary, wheme the name مollidigo, it is said, from lat, solithor, to unite. The leaves of this and a fracrant Nirth American species, is oforf, haw heon used as a sulstitute for toa, 'I 'loy are mildly astringent and tonic.

GOLDEA ROSE, a mose formen of wrought gold, and hessed with much solemmity ly the perpe in persm on Mid-Int smmay, which is called, from the first word of the festival, 'Laetare sumby.' The prayer of blessinf contans a mystio allusion to ore Lord as the thower of the field and the lity of the balleys." The rose is amintel with halswn, fumigated with incense, prinkled with musk, and is then left up"on the altar until the conchasin of the mass. Furmerly, in the solemu papal pocession of the clay, the porne caried it in his hand. It is uwnally presented to sume ('atholie privee, whom the peje desires especially to honamer, with an apropriate furm of worls. The origin of the ecrmony is meertain, hat the most prolshale opinion as to its late is that of Martelne and ha (conge, who fix it in the pontificate of finmeent IV. Fee Wetser's Kirchon Lericon, vol. ix. 30.
(iOLIEEA RULEE, a proces in arithmetic, so called from the miversality of its application. See l'eopurmor.
 promens, a pretty little hird of the family Frinsil-
 amb phosing somg, its intelligence, its liveliness, and the attaclumit which it forms for these who fred ant earess it. 'The genus 'armelis is distimguished loy a thek conical hill, without any halame attemated and very sharp at the tip. There are tworernis, and one british suecies of cach-a group with gay fumate and more prolonged bill, of which the $f$. is the Sritish representative, and another with larker flumbe and shorter hill, representel loy the Ahertevine ( $\AA . v$ ), or siskin. The (i. is abont five imeles in entire leneth; hack, bombern, yellow, amb whote are beatifully mingled in its jumaze. The coloms of the femain are ituiter tham those of the male. It is widely diffuse throughont burope, and is fonnd in some parts of Asia. It is a common hiril in Piritain, more abmant in Eneland than in Scotlaml, lat somewhat liceal. It is to lee seen in small thecks on olen groumds, feding on the seeds of thistles and other plimes, and in the earlier parts of the season frequents gardens and urchards. its nest is made in a tree. hosh, or hedge, is remarkable for its extrome neatness, and is always liued
with the finest downy material that can be promed. The ergs are four or tive in number, haish white, with is few sputs and lines of pale parple and brome. The (i, is much employed hy hird-atehors as at calllime. It can lo trainet to the performane of many little tricks: that which, monst of all, the trainera seem top prefer lecine the raising of water for itede as from at well, in at bucket the rize of a thimble.-
 to the Europem species, has viry simitar hahits and song, 2anl lixplays the sam" intorestime live liness and aflectionateness in Amestication. The most is also of the same clesunt strueture. It is a common birl in most parts of North America.
GOLIOONI, Cunb, the most celdirated writer of ewne ly among the Italims, was lorn at Venice in 307 , and received his dirst edncation at liome. His father oricinally intemded him for an antor, ame titted up a private theatre for his diversion at lome, lat the buy shewn wo aptituly for his. trionic bufmmaners, and in ensembere he was sent to lavia to stmily for the church. (i., how ever, was still less titted for lomer an cecesiantic than an actor, and was linally expellol from college for writmy seluribens satires, $1: 1$ 17al, after his father's doath, he was recrived as intweate; but findine the laral pafession lay momens lucrative, he relinguished its practien, imul set abont compus. ing comic almanaes, which hecame highly Ingular. sureral of his minor emmelies were represented alome this time, and attracted much pallic favour hev their novelty as well as their real merit. In 1736 he spmised the danghtor of a notary of Gichon, anl sulsempently wint tol Imbura, wher, having ohtained an intronduction $t$ o Irince Lab, knvitz, he was intrustel witla the emmonition of an onte in homen of Maria Theresa, amb with the organisation of the theatrical entertamments of the dustrian arny. We next hear of him at lilorence, wombing assilumsly at comedes, which were buwerer, lat an earnest of his best pieces. On his retum to Viniece he malle very lucrative arramements with the manaer of the theatre of sit luke, and after a visit to limue passed into France, ant was appminted Italian master to the royal children, which situation allowed him to devote himself tranquilly to his literary ocopme toms. In I'aris he produced one oi his mont abmired comedies, written in Fronch, and matike $L$ e

(i. liost lins pension, and ded (olannary lash) shertly lefore its restoration ly deren of the Convention. The ercater part of it was allowed to his wilow, who likewise received the arrears due from the tine of
 merit. The larger part are inmitable repusenta. tions of the events of aily life, whtre luth their simplest and most complex aspet. One aim $\mathrm{p}^{n+}$. vales stentily all (i.'s compositions-the alvancement and aration of hamurable sentianents and decels, amd the Hogednation of the prevailing viees and fullies of the day.
 crlebrated swelish singer, was born at ituchluhm, (hetober 6,1 sel. She was of hamble parentase amb her musieal gifts were first notered ly an actress, hy whe intlucnee she wats aniterh, at the are: of nine, into the Conservatory of Sterkliolm, where she received lessons of (riblias and bery. She sany lecine the court with sureess, and at the age of 16 alyared in the pole of latha, in Dere Freischuts. Four years later, she went to I'aris, to
receive lessons from Garcia. Iler voice was now thonght wanting in rohme, and when she appeared at the (rrand Opera two years later, her failute was so murtifyine, that she is sad to have resolved never avain to sing in France. Jetnraug to Stockhom, she was heard with enthusiasm in Fiobert le Diable. and at tho instance of theyerheer was engaged at Berlin in 5 Sto. After singing two yoars in Prussia, she risited Vimna, and other German eities, and made leer dobut in Lomion in 1817, with a very marked success. Her return to Stockholm was grecteal with an oration, and the tickets to the opera in which she appeared were sold at auction. She returned to Londom in 1849, and won an immense trinmath. The royal family and court were present at nearly every representation, and the receipts were often over ${ }^{2} 000$. The London season was followed liy a concert tour in the provinces, with a similar success, and her great popularity was increased by the elistribution of a large part of her receipts in charities. In 1850 she male an engagement with Mi 1'. 'T. Barmum of New York, for a concert tour in America, extending througl the United States, Bitish prorinces, Mexico, and the West Indies. The receipts of this well-managed tour were 610,000 dollars, of which Nademoiselle Lind receired 302,000 duhars. While in America, she was married to M. Otto Gohlschmilt, the pianist who accompanied ber, born at Hamburg 180s. They retumed to Enrope in 185s, ant resided at Dresden after she had visital stockholm, and expended $\pm 40,000$ in calowing schools in her native comentry. Since this period Malame G. has sumg only at concerts in Eng. land and on the continent, and on rare wecasions. Her roice is a coutralto of moderate rauge, but much power and expression. Her kind manners and abundant charities have contributed greatly to her pondarity and success.

GOLDSINNT, or GOLDFDNXY, a name given to certain small species of Cromitubrus, a genus of fishes of the Wrasse family (Lubridu). They are rare on the Dritish consts, hat are more plentiful on those of the north of Europe. They irequent rocky coasts, and are sometimes taken by anglers from the rocks. They receive their name from their prevalent ychow colour. Like the wrasses, they have a very chongated dorsal tin.

GOLDSAITH. Oliver, was lom in the village of Pallas, in the comnty of Lougforil, Irelani, 10th Nuvember 172S. His father, the Fiev. Charles Croldsmith, a clergyman of the Established Church, heht the living of Kilkenny West. At the age of six, $G$. Was flaced under the care of the village schoolmaster, when an attack of small-pox interruptel his studies. On his recovery, be attenled school at various places. On the llth June 174, he entered Trinity Colleqe, Inblin, as a sizur: the expunse of his edncation being defrayed by his mulle, the Fer. Thomas Cuntarinc. At the miversity-where Burke was his contem-porary-ty. pive no eridence of the possession if talent, and becmong involvel in some irremanaty, 'quitted his studies in disqust. He limerevel in boblin thll his fumls were exhangted, then wandern on to Cork, where, he heing in great distress, a hathliol of peas was given him by a ginl at a walke, the Hawn of which remained for ever swont in his momory. Siv his lrother Heary be was brought lack th college, where, on the ${ }^{2}$ th Pemmary 171?, he rectivel the degree of B.A. His unde was now anxious that his hephew shmul anter the chanch; but when he apraral lature the hishonv, he was rejected. His kind-hearted relative then gave him dio, ame sent him to Dublu to study law; but G., beng attrated to a gaming- table,
risked his entire equital, and of courso lost it. Another sum was then rised, and he procceded to Elinburgh to stuly medicine, where he remained is months, but did not take a degree. He then proceeded to the continent, hovered about Leyden for some time, hanting the gaming-tables with but indifferent success; and in February 1755, he left that eity to travel on fout throngh Eurone, scantily provided as to purse and wardrube, but rich in his kindly nature and his wonder-working flute.

After taking bis degree of B.M. at Padna or Louvain, G. returned to England in February 17050, when, by the assistance of Dr Sleigh, a fellowstument, he set up as a physician among the poor. He dil not succeed in his profession, and he is represented as having become usher in the aeademy of Dr Nilner at Peekham. During this period he suprorted himself by contributions to the Monthly Review. He hecame candidate for a medical appointment at Coromandel, but was rejected by the College of Surgeons. The clothes in which ho rppeared for examination had been procured on the security of Mr Griffitbs, editor of the Monthly Review; and as G., urged by sharp distress, had mawned them, his lublisher threatened him with the terrors of a jail. He had now reached the lowest depths of misery; but the dawn was about to break.
His first publication of note was an Inquiry into the Prespnt state of Polite Learning in Europe, and was pullished in ipril 1759. In January 1760 , Mr Newhery commenced the Public Ledger, to which C. contributed the celebrated Chinfse Letters, afterwards republishal under the title of The Citizen of the Horlh. He also wrote a Life of Beau Nash, and a History of England, in is series of letters. On the 3lst May 1761 he was introdneed by Dr Perey to Dr Johnson, who, in his turn, introduced his new friend to the Literary Club, In December 1764, The Traveller appearel, and at once placed him in the front rank of English authors. Two years after this he published the Jicar of Wakefekd, which has now charmed four generations. In rapid succession he produced his other works. The comedy of the Good Natured Mun, in 1767; tho Roman IIistory, in 1768; and The Deserted Jillage -the swectest of all his poems-in 1770. In 1773, his comely of She Stoops to Conquer was probuced at Covent Garden with great applanse. His other works are-Grecian History, 17.4: Retaliation, a poem, 1577 ; and II istory of A nimated Nature, which he did not live to complete. Although now in receipt of large sums for his works, $G$. had not escaped from lecuniary embarrassment. He was extravagant, lured tine living and rich clothes, his charities Were only bounded hy his purse, and he hannted the gamius-table quite as frequently, and with as constant ill success, as of ohl. In March 1774, he came up to London, ill in body and harassed in mind, and took to bed on the 25th. With characteristic wilfuhess and imprudence, he, contrary to the advice of his medical adsisers, persisted in the use of James's Powilers. He became rapidly worse, anl Dr Turton saill: Your pulse is in greater dismoder than it shonld be from the degree of fever you have. Is your mind at ease?' 'No, it is not,' Was the poet's reply, and the last words he uttered. Ite died on the 4th April, £2000 in delit, and more sincerely lamented than any literary man of his time. Uli and infurm peopile sobbed on the stairs of his apartments, Johnson and Burke grieved, and Revmolds, when he heard the news, laid domn lis pencil, and left his studio. He was huricd in Temple Church, and a momment was erected to him in Westminster Abbey, bearing an epitaph by Dr Jolunson.

## GOLISMITIS' NOTES-GOLF.

C. Was the most natural genius of lis time. He did not possess Johnsm's mass of intellect, nor Furke's passion and general furce, hat he wrote the finest poem, the most expuisito novel, and-with the exception perhaps of the sehoul fur sicamint the most delightind comedy of the porion. 13hn. dering, impulsive, rain, and extravant, clumsy in manner and molimitiod in presence, he wals laushed at and ridiculed by his contumporarius; lut with pen in havd, aul in the sulatule of his chamber, he was a match for any of thom, ani took the tinest and kindliest revenges. Than his style-in which, after all, lay his strengthnothing conh be more natural. simph, and graceful. It is full of the most expuisite expressions, and the most cuming turns. Whatever he said, he said in the most gracem! way. Whon he wote nusconse, he wrote it so exquisitely that it is metter often than other people's scise. Johnsm, who, athonarh he laughed at, yet losed and understond him, erticised him admirally in the romark: 'He is now writing a Natural History, and will make it as agreeable as a Fersian tale.' 'The best life of Goma smith is that ly forster, entitlen The Life and Tincs of Oliver (ioklsmith (Lond. lowt).
GOLDSMITHS' NOTES; the earliest form of lank-notes; su called because guldsmitlis were the first binkers. See Fink-sotes.
GOLF, m GOFF, a pastime almost peculiar to Scotland, derives its name from the chol (fete. Kolbe: Dutch, Folf) with which it is ghayel. It is uncertain when it was introduced into somitam, hat it appears to have leen practised hy all classes to a considerable extent in the reign of King Janes?. Charles 1. was munch attachel to the game, and on his visit to Scotland in 1641, was chrared in it on Leith limks when intimation was given him of the relxhlion in heland, wheremon he threw down his clul, and returnel in great agitation to Holyroodhouse. The Duke of Fork, afterwards Janes II., also reliehted in the sans; and in our own day; the l'rince of Wales occasionally practisus it.

Until late years, golf was ontircly confinen to Scotland, where it still maintains its colderity as a national recreation; lout latterly it has leen established sonth of the Tween, as well as in many of the British eolonics. It is plityel on what are called in Scotland finks (Ens. (tuches), that is, tracts of sandy suil covered with short grass, which necur irernently alons the east enat of sonthan. St Andrews and Leven in life. l'mestwick in Ayrhire, Muswellorgh in Nit Luthian. North Derwich and Gullane in Fast Lothian. Carametic and Aontrose in Forfashire, and Aberten, are examples of admirably suited links, as the grount is diversified by knolls, sand-pits, and other haecerds (as the: are terned in golting lhasendgy, the avomine of which is one of the most inurortat points of the ganle.

I scries of small roum lones, alout four inches in tianseter, am several inches in dith, are ent in the turf, at distances of from one tis four or five bundrel yards from each wher, according to the nature of the sroumd, so as to fom a cirenit or round. The rival phows are ether two in number, which is the simplest arrampmont, or $\mathfrak{f o u r}$ (two against two), in which case the two partners strike the ball on their side alternately: "rine lalls, waighing about two onuces, are made of guttapercha, and lamied white so as to le realily seen.
An ondinary enlf-elub comsists of two parts spticed tugether-namely, the shaft and head: the shait is msually malc of lickory, or lance-wood; the hamde covered with leatler; the head (heavily
weighted with lean behiml, and iacal with horn) of well-seasonem a aphetree of thom. Lewry player has a sel of dubs, difterine in lemeth and shape to suit the distance to lue friven, and the position of the ball; for (except in atriking olf from a hole, when the latl may be troll-i.a, dacel abluantareonely wa little haty of sum, callel a twa it is a rale that tha" hall must lie strmele as it hasprecas to lie. Sume positions of the bald rempire a club with

Club Itcads:

and remarkable for the large size of some of the specics, particularly the Arican ones. They are also, in respect of their colours, splendid insects. Little is known of their halits.

GOLLNITZ, a small town in the north of Hunfary, in the comenty of Zips, is situated on the left hank of a river of the same name, a fecder of the Hemad, 17 miles south-west of Eperies. It has impurtant iron aml copper mines, and manufactures of wire and cutlery: P'op. 5200.

GOLLNOW, a small manufacturing town of Prussia, in the province of Pomerania, is situated on the riorht bank of the Jhan, 15 miles north-cast uf Stettin. It was formerly a Hanse-town, and is survouded by walls, and idefended by two forts. Tho mannfactures are woollen clotis, ribons, paper, and tubaco; there are also coplper-works. I'op.

 remarkalle tish, forurl only in Lake Haikal, the unly known species of its genus, which belongs to the gohy family. It is about a font long, is destitute uf seales, and is very soft, its whole sulustance alomuling in oil, which is obtained from it by 1ressure. It is never caten.
(ioLO'SHES (formerly callet galoshes), from Gatuche, a word throngh the French, from Gialurha, the spanish for a patten, clog, or wonden shue. The French applied the term at first to shoes partly of leather and wool, the soles being wool, and the "plers of leather. The temm was introdncet to this country as a combainer's technicality, to signify a methon of reparing blid loots and shues by putting a narrow strip of leather above the sole so as to surromm the lower part of the 1 uper leather. It was also adopted ly the patten and clog makers to disthuruish what were also called Erench clugs from urininy clugs aud pattens. Clogs were more soles of word with straps aeross the instep to kerp them on: pattens were the sanc, with irom rings to raise them from the groumal: but the galushes were woulen sules, usually with a jaint at the part where the tread of the foot came, and with Mreer leathers like very low shoes.

Now, however, these elogs, pattens, and goleshes
have completely passed away exequt in som rural districts whin atre almest manessihk to nombun inventims: the Amrican bolnshes have entirely superseded them. 'Ilhese are manufactured of vulcanied lmbia ruhnu or cantohone, anl? aro now male in the most clowant forms ; lome wa-tio, they are worn as werslanes in wet wother, and are at excellent remection to the feet. CODHU'TO, ARENG, or EJOO PALM (Arengr sacharifery. or Saqmipus Pumpheit, an important paln which grows in C'nchin China and in the islands of the Indian Arehipedago, partiendaly in moist and shaly ravines. The stem is $20-30$ fret high; the leaves 15-0.3 feet long, pinnated. The flowers are in bunches 6-I0 feet long; the fruit is a yellowish. brown, three-sceded lurry, of the size of a small apple, and extremely acrid. The stem, when youns, is entirely covered with sheaths of fallen leaves, ani Mack torse-hairlike fibres, which issue in great ahmolance from their margins; lut as the trew increases in arce these hrop oft, leaving an elecant naked columnar stem. The strongest of the fibres, resembling percupine quills in thickness, are used in Sumatra as styles for writing on the leares of other palms. But the finer filores are ly far the most valuhble; they are well known in eastem commerce as Comuto or Ejoo fibre, and are much used for making strong corlage particularly for the eables and standing-rigging of ships, Emrintan as well as native. Want of pliancy remlers them less fit for runuing-rigging, and for many other purposes. They need no preparation lint spiming or twisting. No ropes of vegetable tilue are so imperishable, when often wet. as those made of Gomato tibre. At the Lase of the leaves of the Gomuto pam there is a fine woolly naterial, callen brow, which is much employed in caulkiner ships ant stufting cushions. The stem contains a large quantity, 150 -200 llos., of a kind of sago. The saccharine sap, whatineal in great abondance by cuttin! the spanlices of the flowers, is a delicions beverage, and by fementation yiches an intoxienting palm wine (norm), from which a spiritmous liquor called brum is made.

GONAI'YES, a seaport of Hasti, with an exeellent harbour, stands on a hay of its own name. which deeply indents the west const of the island. It is 6.5 miles to the north-west of Fort lionulicuin, formerly Port au Prines, the eapital.

GO'NDAR a city of Alyssinia, capital of the linglom of Gondar or Amhara, is situater in lat. $10^{\prime}: 3 h^{\prime} N$, aud long. $37^{\circ} 29^{\prime}$ E. on an insulater hill at an elevation of 7420 feet above sea level, and is 30 miles distant from the northern shore of Lake Dember or Izana (see Aetssinia). ( f , is the rasidence of the emperor or Negus, whose authority is now nerely nominal, and at me time had from 50 to 100 churches and alout 50,000 inhabitants; hat since the dismemberment of the lingdom, it has greatly deelincd, and its extent or population cannot now lee accurately stated. It is poorly and irregmarly built, and resembles a wood rather than a city, on account of the number of trees surroundine the harses. 'The palace of the emperor, a sfuare stone structure laukind with towers, is the most imprent huiding. There are no shops or bazaars, all the artiches for sale being exposed on mats in the market-phare. (i. has manufactures of firearms, sword-1才ates, laives, scissors, razors, shields, podtery, de.; and a considerable transit trade letwen Massuah on the Red rea anl the sonth of Abyssinia, in slaws, musk, wix, ifory, coffee, loney, \&c. The mean temperature of $\mathrm{F}_{\mathrm{a}}$. as wherven ly fiupull during the scren montlis from Octoler to April inelusive, was 6a' and the lowost temperatur" thring that time was sero3. A great quantity of min falls here.
0.4

GO'NDOLA (ltalian), a loug narrow boat (averaging 30 fect ly 1) used chictly on the canals of Venice. The prow and stern taper to a point, and curve out of the water to a height of at least 5 feet.

In the centre there is a emtained chamber for the occupants: the boat is propelled by means of oars or poles loy one, two, or occasionally four men. The rowers stand as they row, and wear the livery of the family to which the gondola belongs.

The term gondola is also applied to passage-boats having sin or eight oars, used in other parts of Italy.

GONDWANA, the land of the Gonds, is a hilly tract of ITindustan. lying between $19^{\circ} 50^{\prime}$ and $\because 4^{\circ}$ 30', and in E. long between $77^{\circ} 35^{\circ}$ and $87^{\circ}-0^{\prime}$. It occupies a somewhat central position, sending its drainage at once northward into the Jimma, eastward through the Mahanadi into the Bay of lencal, and. wustwarl thrmegh the Tapti and the Nerlsulda into the Arabian sea-the water shed in snme places attaining an clevation of 500 fect . So isolated I a locality, besides being in itself unfavourable to eivilisation, is rendered still more so by the extreme baplarism of the inhabitants, who are recarded, with some appearance of probability, as the gemuine aborigines of India. Certain it is, that the country has never really formed a part of any of the great empires in the cast.

GO'NFALON (Ital. gonfultone), an ensign or standarit: in virtue of bearing which, the chief magistrates in many of the Italian cities were kniwn as gonfaloniers.

GONG, an Indian instrument of percussion, made of a mixture of metals ( 75 to $S 0$ parts of copper, and $2: 2$ to 20 parts of tin), and shaped into a basinlike form, flat and larse, with a rin of a few inches drep. The sount of the ( F . is produced by striking it, while lung by the rim, with a wooden mallet, which puts the metal into an extraordinary state of vibration, and prodnces a very loud piercing somir.

GoNGORA, Le1s Y. Arcome, a Spanish poet, was born at Conlowa, llth Judy Ingi; studied law at the university of salamanca, where he composet the grater lait of lis erntic foms, romances, aud satires. At the age of 4.3, he took orders, and nitained a small prehend in the cathedral of Corlova. He was afterwards apminted chaphan to Philip 3 II, and died in his native city 2 th May 1627 . (i.'s $1^{\text {metie }}$ career diviles itself into two periods. In his first or youthful periond, he yielded himself 1 up eatirely to the natural temencies of his genius, and to the spirit of the mation. His lymes and romances of this period are in the old
genuine Spansh style; and in respect to their canstic satire and hurlesque wit, are ammong the most manirable specimens of the class of pocms to which they belonif. (i, howerer, wished to motelo all his prodecessoma, and to fumish sompthime wholly new and mheard of t the result of which nnfortmate ambition was the intron?uetime of a new pretic phrasonlogy, eallmi the wallo culio, or the 'cultivated style.' Fronn this point the swomel period in G.'s literary eareer dates. Ton jopularise the estilo culto, lie wrote his Polifemo, Sululetion, anel the Fubles of $P$ aromuts and $T^{r} h i s h o$, proxluctions of the most pedantic and tasteless dascripition, fur in invention and thotroht, but rich in lifub-sommling ponpous fhrases, and overlumled wath alisuril imagery, and mytholorical allusions, weressent in language of strilied obscurity: In this way he became the "ounder of a ww school, the diomporistas, or Cultoristos, who even sumpased thair master in the depravity of their literary tastex. 'The most complete edition of (i.'s works is that hy diomzalo
 romances have bea translated into (ruranan by $J$. G. Jivcoli (Halle, 1767).
 mollusca, ly longing to the sane funily at the ammonaites. The genus is charuterisel liy the structur" of the septa, which are lobed. hat without lateral denticulations, as in ammonites; they eomsemumtly exhibit, in a section, a enntimuns mulutating linc: Some forms with slighty waver septa approach very near to the nantilus, from which, however, they are at once separated, liy the prosition of the small and delicate siphmade, which is on the dorsal or exteraal sile of the sluell. 'lhe limes of growth on the extornal surface have a sigmoid firection. ${ }^{3}$ He siphonal portion is shorter than the siles, form. ing a sinus at the back. as in the nautrlus. "lae last ehamber, the one tenanted ly the animal, oceupies a whole whorl, and las luesines a cumsiterable lateral expunsion. The shells are small, sehlom excemeling six inches in diameter.
'Ihis gemus is confined to the labroznic strata: upwards of 1.39 species have luen duscribed from the Itevonian, Carbonfermus, and Triassic mosusures.

GONIIDlA (Gir. goné, genemation, anl eidos, an appearance), small scen bodies which in same cryjutogamons phants scrve the purpose of wimalnetion, lut apparently aiter a manom amalusons to that of bullils in phancropiumons phants, rather than by true fructificalion. It is nut, lowover, cortain tiat the bodies called gomidial in ditierent classes of eryptogamons plants are all of exactly the same nature The gonilia of Lichons (4]. W) :re fomme in layers in the interior oif the thallus. In some of the lowest vercotable organisms, as Desmidiacor, the gondia are formed by the enduchrome wo contents of the cell breaking nu into grankle, sometames mbested with cilia, and bovines as zorspures, it first within the eavity of the eedl on which they are formed, and afterwaris without it.

GOS1O'NETER, an instmunnt fur measuring the ancles of erystids. The simplest instrunnent is that inventel by t'arargean, whuh consists of two brass rulers turainis on a common centre, lectween which the erystal is so placed that its faces coin. cide with the elres of the ralers, and the angle is measured on a Ermiuated are. For large crystals this is sulliciently aceurate, but as many minerals are found crystallised only in smatl erystals, and is small erystals of any mineral are generally the most perfect, an instrument caprable of measuring more exactly was required. "The one generally in use is the retlecting goniometer invonted ly Wullaston, and improved by Nauman. Nlis is a
more eomplieated instrument, yot easy of alrlication, and it wall mostsure very small crystals with cortainty to within a single mimen (l'). 'The anule is measured hy the relloction of the rays of light from the surfine of the difinment faces of the crystal.

GONVVLLE AND CAITS COLIAEGE. CAM.
 Gonville, son of Lir Nicholas (innville, rwetur of Terrington, in Sortolk, and colowed for a master and three follows. In lane, Williom Jouteman, Bishop of Norwich, whom (innville han inpuinted his executor, chanderl the sitnation of the colloge $t$, its presult site, and alteref the name to the " llall of the Ammanciation of Blessed Mary the Virem.' In
 the collace for the thind tinm, and alteriner the mane to that which it now hars. Hy the present statutes, the eoliene consists of a master, thinty fellows, and thirty-six scholars. There are also it this college fomer stmentships in medicine, fonnded by Christimber lancred, each of the anmal value of $511:$

GONZAGA, a town of Forthern ltaly, 14 miles sonth-sunth-east of Mantua, with J $4,5 \times 0$ inhalntants, is the chicf town of the listrict of Gonzama, of which thu promation is $2 \& .511$. The town was fommerly fortificol ami protected hy a stronis eastle, and sume assert that the fanily of Gonanas, whu rulad fur funr conturies ober Nantan, origimated in this lncabity, 'Ilow territory surronning (i. is a well-watered amblerthe flain.

CONZAGi, House of, : frincely family of Gemuma origin, from which spanme a lanit line of soveriga lykes of Mantnat and Muntiomat. The sway of this race over Mantua extembed over a priml exceding three centurios, and many of its mombers wore mannicent promoturs and cultivators of arts, science, ame literature. Wiehling origimally in the state the vast civic inlluence which in su many instance's we tiad exercised hy tamilies of weight in the listury of latyr, the donzagas mathially monopulised all the chice posts of commanat,
both civil and military : and finally, in 1432 , were invested with the title and jurisdiction of hereditary marepuiss, and in 1530 with that of dukes or sowercisus of the state. After their devation to ducal dignity, they continted to nwo the fembal surpemacy of the empires and were the faithiful champans of the imperial interests in their puliey with nther' stictos. The House of (i., and that of the Vemonti Inkes of Milan, were perpetually at war. The mast illustrions personames of this race were (inminni fraveeseo ( 1407 - 144 ), in whene favour Mantua was creatod a marquisate by the limperor kigismund, in return far his services to
 defeatend Charles Vlll. of Frane at the battle of Formow, on the banks of the 'lare, 1495, when G. left bant troms on the fiedel, and Cllardes was fured to in hasty retreat. (A. also tonk part in the engagement of itellis, $1+96$, which led to the capitnlation of the French forces. His shm, Friderink 11. ( 1519 -1540), in reengnition of the services he rendered the inperial forces in their contest with Frace, was iurested by the Emperor Charks V. with the ehueal dignity in 1530, and also oldamed the marenisate of Montferrat in 1536 . Jurine the reign of this prince, the court of Mantua was one of the must magnificent aur gay of Eurnpe(icelielam ( $1000-155$ ), the som of Frelarick, was humpbacked, lout proved a wise and enlightemed ruler; his secretary was Bemarlo 'Tasso, father of the foct- Pisiceizo ( 1507 -1612), son of Gughielum, was the wam friend and patron of Tasso, and succeeded in obtaining the poet's freatom, when he was emfined as insame liy the buke Alfonso deste.- Vincenzo was much estermed fur his phety, justiep, and liberality. He was successively followed by his three sons, Francesco, Ferdinands, and Vincentio, who died withont heirs, and thas the direct line of the dueat lranch leeane extinct. A collateral branch, in the person of Chates 1 ., Buke of Nevers, son of Ludevioo, the brother of Gnclielmo the homblacked, elnimed the dewhy, whim was crintestel by lis consin Cusar, Duke of Guastalla. This fanily fend led to a general war, in which France supported Nevers, and the empire clamed the right of aljudging Mantua, as an imperial dicf, to a conchilate of imperial election. Mantma in 1609 was stomed, sacked, and stripyed of all its mamificent possessions, by the imprialists, and never reyained its former sphembour. Charles de Nevers sumitted finally to the emperor, and was installen in the duchy. The artistie treasures collected fir ages by the C. princes were sattered throughout Europe, and came into the possession of several of the regning sommigns. The successors of charles were dissipated amd silly, and the tenth and last Wuke of Mantra. Ferdininet-tharles, was the most contemptible and dissolute of all. As he
had conutenanced the Frenely in the War of thr. Sinccessim, the Empror Juseph I. deprived him of his states, freing him muler the ban of the empire. He died in exile in 170s, leaving no issue.

GONZALC゚O DOI CORDONA (G. Hernandez y Aguilart, a ecoblated Subuish warrior, was born at Dontillo, noar Corlova, in 14.33 . He servel with groat distinction lirst in the war with the Honers of timanda, amb afturwards in the Portuguese camping. At the close of the final contest with (rrmanda, he conclmbed the merotiation with
 such a masterly maner, that the rulers of span bustowed mpon himi a pension and a large estate in the conpucred territory. He was rext sent to the assistance of Fertinand, king of Naples, aquinst the French. In luss than a year, G., with his limitent resources, had ennmored the greater gart of the kiuchlom, and ohtaincel the appellation of 'El (Eran Chyitano.' In comjunction with King Ferdinabd, he succeeded in eomplately expelling the French frem Italy; and in Angust J ins returned to spain, having reccived in return fur his valuable services an estate in the Ahmazi, with the title of buke of san Augela. Whan the partition of the kingitom of Naples was tetermined upon by a compact entered into at Gramala, Ilth November 1500, (. agam set out for Italy, with a body of 4300 mon , and on the way took Zante anel Cephalonia from the Turks, and restored them to the Venctians. He then landed in Sicily, occupied Nialles and Colalmia, and demanded from the Fremelh that, in comphance with the compact, they should yielil up ('apitamata and Basilicata. This demand being rejected, a war liroke out between the two ludigerent jowers, which was waged with varicil suceess. After the victory of Cerignola, in April 1503, tr. thok possession of C'alabria, Abruzzo, Apmlia, even the city of Naphes itsclf, and then land siege to ciacta. Inat was foreed to retreat before a superion force of the enemy. On the ohth Decemher of the same year. huwever, he fell won them mexpectelly near the Garighans, and oltaned a complete vietury, 9 ath December 1503 . The Freneh army was almost amihilated: the fortress of Gaëta fill; aml the possession of Naples was secureal to the Spaniards. King Ferdinand bestowed the duchy of Sesa up, the conqueror, and appointed him viceny of Niples, with mlimited authority. His good-fortme, however, male him many jowerfnd chemios; and (i, was recalleml to spain, where the king treated him with marker neglect. $G$. now betouk himself to his estates in Cimuadia; lont after the defat of the new viceroy in Niples by Gaston de Foix, he was again appointel to the command of the Spanish-Itelian army. Mental suffiring, however, lawl molermined tho wht hero's health, and on the ofl December 1515 he died at Granadia.
